The diagnosis of food-poisoning when a number of persons are affected usually presents few difficulties, but the diagnosis of an individual case may be far from easy. It should be borne in mind that an accusation of food-poisoning is a common form of blackmail brought against expensive restaurants. In such cases the doctor should never give a certificate to say that the patient has suffered from food-poisoning without the fullest supporting bacteriological and epidemiological evidence.

The symptoms in any single outbreak vary considerably in severity: some patients complain of no more than a vague discomfort which is disclosed only on questioning, while others are severely ill. These latter range from those whose main symptoms are diarrhoea and vomiting to those in whom these symptoms may be overshadowed by a clinical picture more closely resembling that of enteric fever. The symptoms vary with the agent which has caused the food-poisoning, but only the more usual types encountered in this country are dealt with. The most common type is that due to the bacterial infection of food and drink.

The incubation periods of the different types of food-poisoning may give some indication of the cause. Chemical poisons are usually rapid in their effect, symptoms occurring with a sudden onset in about half an hour or less. The toxin type, being due to the absorption of preformed bacterial toxin, also has a short incubation period, though it is longer than that of chemical poisons. The incubation period of the toxin type is between 2 and 12 hours, and there is also a sudden onset. Food-poisoning caused by the multiplication of organisms in the intestine has a longer

incubation period, usually between 12 and 48 hours. The onset of this type may be sudden, though a number of patients complain of feeling ill before the main symptoms occur.

Incubation Period of Food-poisoning*

Chemical	Bacterial Toxin		Infectious
	Staphylococcus	<i>Cl. welchii</i> and Streptococci	
0-30 minutes	2 hours	12 hours	20 hours

In all types the patient usually complains of nausea, vomiting, and diarrhoea. Commonly there is also headache, abdominal cramps, sweats, shivering, and giddiness. At the height of the illness the patient may be severely prostrated. In the toxin type the disease is of sudden onset and may be very similar to sea-sickness: the more severely ill patient is in a state of collapse and unable to stand; he sweats, and does not care whether he lives or dies. These patients commonly have a subnormal temperature; it is rarely above 99° F. (37.2° C.). They recover rapidly, usually in 24 hours.

In the infective type the disease develops rather more slowly and is accompanied by a rise in temperature, commonly to 102° F. (38.9° C.). The abdominal pain is of a colicky nature, starting usually in the epigastrium but spreading over the whole of the abdomen. Though the abdomen is tender there is no rigidity. The disease usually lasts for about four days and the patient complains of lassitude for some days more. The severely ill patient may look drawn and show signs of dehydration. If death supervenes it is usually about the tenth day of the disease, but death is unusual except in the very young, the old, or those with some additional serious illness.

The vomit is watery; it may be bile-stained, but is only tinged with blood if vomiting is excessive. The stools are watery, usually with faecal colouring, and they are very offensive. Blood is not often present and the mucus tends to be slimy, whereas in dysentery pus and blood are usual. In salmonella infections some patients may show the rose spots and the clinical picture of enteric fever. Patients generally recover rapidly. A certain number of the infective type may be operated upon as cases of appendicitis. It is probable that in these the appendix is inflamed, but the symptoms usually subside as the patient recovers, without necrosis of the appendix.

Complications may occasionally be encountered with salmonella infections. Very rarely empyema, purulent arthritis, or osteitis occur. Meningitis may be found more particularly in young babies. Occasionally patients have a long febrile period, sometimes of a septicaemic type. After an attack of food-poisoning some patients become prone to dyspepsia and intestinal upsets.

Differential Diagnosis

Correct diagnosis is important from the point of view both of treatment and of preventing fresh cases. In dysentery vomiting is seldom a major symptom and rarely lasts for long. In addition the stool is usually blood-stained and contains large numbers of pus cells. Intestinal obstruction, intussusception, or volvulus usually cause localizing signs in the abdomen which are absent in food-poisoning. In practice these conditions are rarely confused with food-poisoning.

A disease which occurs in this country is extremely difficult to distinguish from food-poisoning of the types already described. This condition, which occurs more commonly in winter and spring, cannot be traced to any particular food. It may start by affecting a number of persons at the same time, and when institutional outbreaks occur

*From *Modern Trends in Gastro-enterology*, edited by F. Avery Jones. Rutterworth and Co., London.

secondary cases are the rule, usually with an incubation period of three to five days. A good review of this disease has been given by Hargreaves,* who refers to it as "epidemic diarrhoea and vomiting," though its more usual name is "the winter vomiting disease." In America similar outbreaks have been studied, and as the result of various investigations it seems probable that a filterable agent, probably a virus, is excreted in the faeces. The onset of the disease is sudden and not uncommonly occurs at night. The main symptoms are vomiting and diarrhoea, but vertigo may be a prominent symptom. Some patients have complained of acute upper abdominal pain, and some tenderness is elicited on deep palpation over the liver area. The differential diagnosis between these patients and true cases of food-poisoning presents many difficulties.

Treatment

Rest in bed is essential in all definite cases of food-poisoning, as recovery is always more rapid and relapses less common if this is observed. The treatment should be symptomatic. If poisoning by chemicals or fungi is suspected the patient's stomach should be washed out with the specific antidote if the offending chemical is known, otherwise with normal saline. In the early stages of other types of food-poisoning patients who are vomiting should be given a glass of warm water containing one teaspoonful of sodium bicarbonate in order to get rid of excessive mucus. If as the result of vomiting and diarrhoea the patient becomes dehydrated intravenous glucose saline should be administered. Persistent diarrhoea may be treated with bismuth carbonate or subnitrate. Opium in any form should be used only if there is no doubt about the diagnosis.

A specific antiserum for poisoning due to *Amanita phalloides* is available.† This serum should be injected intramuscularly and given as early as possible in the disease. The dose for a child is about 20 ml.

There are no specific remedies for bacterial food-poisoning. Antibiotics have been tried, but they have not given good results in the ordinary disease in which diarrhoea and vomiting are the main symptoms. Rarely some cases caused by salmonella infection may have a long-continued fever suggestive of septicaemia. In such cases chloramphenicol should be tried, as some patients seem to improve clinically; the drug does not, however, appear to shorten the period during which the organisms are excreted in the faeces, nor does it have any effect on the carrier condition. The usual dose of chloramphenicol for adults is 50 mg. per kg. of body weight in 24 hours. It is given at intervals of six hours, and should be continued until symptoms have been controlled, after which the dose should be halved for a further three to four days before stopping treatment. During the convalescent period the change to normal diet should be made gradually, particularly in patients who show a tendency to relapse.

Prevention of Spread

In salmonella food-poisoning the patient's excreta should be treated as in typhoid by the addition of 1:20 carbolic acid, corrosive sublimate, or other disinfectants which are known to act on Gram-negative organisms. The patient should be warned of the possibility that the organisms may be excreted for some time after recovery and told to wash his hands after defaecation and before taking food. He should not be allowed to handle food until laboratory tests have shown that the organism is no longer being excreted.

The prevention of bacterial food-poisoning depends on the education of the public in personal hygiene, in clean

methods of food storage, and in clean methods of food preparation. Emphasis should be placed on the desirability of keeping food cool, preferably in a refrigerator, until it is ready for cooking; if it is not eaten immediately after cooking it should be rapidly cooled down and kept cool until it is reheated.

Under Section 17 (1) of the Food and Drugs Act, 1938, it is compulsory for a registered medical practitioner who becomes aware of or who suspects that a patient whom he is attending is suffering from food-poisoning to notify immediately the medical officer of health of the district, giving particulars of the case. If this is done early, laboratory investigations may determine the cause of the disease, the food at fault, and the source of the contamination. Such information will help to stop the spread of the disease.

Next Refresher Course Article.—"Tenosynovitis and Tendovaginitis," by Mr. D. Lloyd Griffiths.

MEMORANDUM ON FAMILY PLANNING, WITH PARTICULAR REFERENCE TO CONTRACEPTION*

The subject of family planning is clearly of fundamental importance to the welfare of the community. The Royal Commission on Population, after sifting evidence from many sources, expressed itself as in no doubt of the need for a positive family-planning policy. The National Health Service Act makes provision for the care of pregnant and parturient women but does not lay down any plan of action in respect of family planning, though it may be argued that this should come under the heading of general medical services.

Family planning can be considered under three main headings: (1) the need for facilities for contraception; (2) marriage guidance; and (3) the treatment of involuntary sterility. As regards marriage guidance and the treatment of infertility, there is general and indeed increasing support from all sections of the community, irrespective of religious beliefs. But on contraception opinion is still sharply divided, and a certain number of persons, including all Roman Catholics, regard the use of appliances and withdrawal as morally unjustifiable in any circumstances. They object to public moneys being spent on any clinics where contraceptive teaching is given, or on contraceptive appliances. The use of the "safe period" is, however, accepted by the Roman Catholic Church, and, where spacing is indicated for health or social reasons for such patients, this method may be advised.

Inquiry into the Position

Towards the end of 1949 the Family Planning Committee of the Medical Women's Federation instituted inquiries to ascertain the position of family planning in respect of its three aspects—contraception, marriage guidance, and the treatment of involuntary sterility—as it stood after more than one year's working of the National Health Service Act.

The medical officers of health of 197 local authorities were circularized and were asked the following questions:

*A memorandum prepared by the Family Planning Committee of the Medical Women's Federation: Miss Beatrice Turner, F.R.C.S., F.R.C.O.G. (chairman), Dr. Annis Gillie, Dr. Olive Gimson, Dr. Margaret Hadley Jackson, Dr. Isabelle Little, Dr. Mary Macaulay, Dr. Joan H. Buchanan (honorary secretary), with Dr. Doris M. Odum and Miss Josephine Barnes, D.M., F.R.C.S., as *ex-officio* members.

*British Medical Journal, 1947, 1, 720.

Information Received from 159 Medical Officers of Health of Counties and Cities in Great Britain

	No. of Replies Recd.	Negative	Affirmative	Affirmative Replies		Local Authority Own Clinics	Local A. plus Vol. Clinics	Voluntary Clinics Only	Remarks
				Contraceptive Advice Only	Contraceptive plus Subfertility and Marital Difficulties				
England	107	51	56	29	24	20	9	25	6 among negative replies (as classified) state suitable cases referred to antenatal clinics and some to gynaecological department at hospital. Four to voluntary associations such as Marriage Guidance Council and Family Planning Association
Scotland	39	29	10	3	5	3		3	5 in the 29 negative classification state antenatal clinics sometimes used. One stated clinics at considerable distance deliberately chosen if consultation advisable
Wales	13	8	5	3	2	2	1	2	4 out of the 8 negative replies state existing antenatal clinics meet need. Occasionally gynaecological department at hospital used

N.B.—Where totals do not tally it is because some replies were in the affirmative but no details were given of the type of advice or clinics available. Some replies stated, "No family planning arrangements," but proceeded to state, "Birth control clinic run by local authority." Such replies have been included in the affirmatives.

Do facilities exist in your area for the giving of advice on family planning? If so, are they for contraceptive advice only, or do they also cover the investigation of infertile marriage and of marital difficulties? Do you provide your own clinics, or do you rely on voluntary clinics in part or altogether?

In response to this inquiry 159 replies were received, and the answers are summarized in the Table. The most striking fact that emerges is that in well over 50% of all areas no clinics or special hospital out-patient facilities were available.

The deans of 27 medical schools were also circularized and were asked whether instruction on contraceptive technique and on the investigation and treatment of infertile marriage was given to medical students. Twenty-four replies were received, and these indicated that in most medical schools some sort of instruction, though sometimes an outline only, is included in the course of ordinary obstetric and gynaecological teaching. In only four were special lectures given on family planning and contraception. Practical experience in the fitting of caps was provided in a few cases by attendance at neighbouring voluntary or municipal birth-control clinics. Only two teaching hospitals held special sessions for out-patients where contraceptive advice was given, but a number held fertility clinics. Attendance by students at these was on a voluntary basis and was not regarded as an essential part of the curriculum. In fact, three medical schools expressed the opinion that these subjects were more satisfactorily dealt with after qualification.

Two main facts therefore emerge from this inquiry. First, that the facilities for family planning which existed in 1949—and there is little reason to suppose that there has been any great improvement since then—are totally inadequate for the needs of the community. This applies especially to contraception, since advice and treatment for infertility are given in many gynaecological departments which do not provide separate clinics for such cases. Secondly, the majority of medical students are qualifying without receiving an adequate introduction to all the aspects of family planning and cannot therefore be expected to give authoritative advice to their patients or to recognize the need for postgraduate training in the subject.

As to contraception, it is important that all general practitioners (apart, of course, from those who have religious or other objections) should have, as a minimum, knowledge of the best and safest methods. The public still turns naturally to the medical profession for advice on this matter: if this advice is not forthcoming, then those less reputable firms who advertise widely will replace informed medical advice. The methods advocated by such firms are often unsatisfactory and the accompanying literature distressing and distasteful. This has important repercussions, since failure of contraception is a serious factor in leading women to

criminal abortion, and in addition family instability is increased when attempts made to space pregnancies fail.

The G.P. and Family Planning

The place of the general practitioner in the sphere of family planning is an obvious one, although no special provision is included in the National Health Service. Certain points may be made. It is manifestly impossible to prohibit any duly registered medical practitioner from practising any branch of the art or science of medicine. It is obvious, too, that over large areas of this country the family doctor is the only accessible person to give advice on contraception. It is not always so clearly recognized that the time required to fit an inexperienced or worried woman with a contraceptive appliance may be considerable and is not easily given when the case is seen during a surgery hour. The actual technique of fitting is relatively quick when accuracy is maintained by practice, except in a minority of cases. The training of the woman, however, to use the appliance and to ensure that she has accepted the idea of its regular use without reluctance or distaste often requires considerable time and patience. The general practitioner's knowledge of the woman herself and of her home conditions is an advantage often overlooked, especially when advice on marital difficulties is sought at the same time.

Many general practitioners undertake to give contraceptive information: most of these have made a special study of the subject, and some have had experience as medical officers at birth-control clinics. On the other hand, others prefer to send their patients to clinics which specialize in this particular branch of medical work. There are some patients, too, who prefer to consult a stranger on the question of contraception rather than turn to their own doctor. The outlay of considerable time on such work as part of the general medical services must necessarily deter some practitioners, especially those with the larger lists of patients.

Women seeking contraceptive advice fall into two main groups. First, those who on medical grounds have been advised to avoid pregnancy. It needs emphasizing that the general practitioner in such a case must ensure that his patient does secure contraceptive training from the best available source. Only too often the advice to prevent pregnancy is not accompanied by specific training on contraception or a letter to obtain such training from a clinic, hospital, or colleague. The second and continually expanding group is made up of women who wish to plan their family with intervals between the births of their children. It is these who present a challenge to the medical profession, since they can easily obtain non-medical advice which is increasingly freely advertised and is often of poor quality. Women who seek contraceptive advice

DESIGNED

FOR FEWER SIDE-EFFECTS

NEW

For local application, 'Histantin' is now also available as 'Histantin' Cream, 2 per cent, in tubes of $\frac{3}{4}$ oz. (approx. 20 grammes)

Nearly 100 derivatives of piperazine were synthesised at The Wellcome Laboratories before workers there were satisfied that one compound, 'Histantin', offered a noteworthy advance in antihistamine therapy.

- 'Histantin' produces fewer side-effects.
- 'Histantin' provides prolonged action—a single daily dose suffices in most cases.
- 'Histantin' is chemically unrelated to other antihistamine agents. Compressed products of 50 mgm. in bottles of 25, 100 and 500.

'HISTANTIN'

CHLORCYCLIZINE HYDROCHLORIDE

[DL-1-(p-CHLOROBENZHYDRYL)-4-METHYLPYPERAZINE MONOHYDROCHLORIDE]

The NEW TYPE antihistamine

BURROUGHS WELLCOME & CO. (THE WELLCOME FOUNDATION LTD.) LONDON

*Effective
oral treatment
for peripheral
vascular disorders*

TOLAZOLINE HYDROCHLORIDE -BOOTS

2-Benzyliminazoline Hydrochloride

Literature and further information obtainable on request from the Medical Dept.
BOOTS PURE DRUG COMPANY LIMITED NOTTINGHAM ENGLAND

TOLAZOLINE HYDROCHLORIDE-BOOTS is a sympatholytic and adrenolytic compound exerting a vasodilator effect, chiefly on the peripheral arteries and arterioles.

It is indicated in the treatment of intermittent claudication, Buerger's disease, peripheral vascular disease associated with diabetes, Raynaud's disease, thrombo-phlebitis, chilblains.

It is supplied as tablets for oral administration and also as a sterile solution for intramuscular or intravenous injection.

S91.

New!

A Combination for the Treatment of BRONCHIAL ASTHMA

TO meet the physician's demand for a prescription which provides *combined* bronchodilative and sedative effects, the House of Wander now makes available 'Asmac' Tablets. This new preparation is clinically proved as a valuable adjunctive routine measure in chronic bronchial asthma.

Formula (each tablet):

Allobarbitone B.P.C.	0.03 gm. (0.46 grain)
Liquid Extract of Ipecacuanha B.P.	0.02 ml. (0.34 minim)
Ephedrine Hydrochloride B.P.	0.015 gm. (0.23 grain)
Caffeine B.P.	0.10 gm. (1.54 grains)
Theophylline with Ethylenediamine B.P.	0.15 gm. (2.31 grains)

P.1, S.1, S.4. Permissible on N.H.S. scripts

'Asmac' Tablets comprise only 'official' drugs. These, used either separately or in various combinations, have long been recognized in the treatment of bronchial asthma. Now, the new product, by combining them in a single tablet, provides the advantage of a prescription which effects concurrently—

SEDATION — — —	to reduce susceptibility to attacks
DECONGESTION — —	to ease the respiratory mucous membranes
EXPECTORATION — —	to facilitate liquefaction of tenacious sputum
BRONCHODILATATION	to relieve the tonus of bronchial musculature

PRESENTATION:

on these social grounds are glad to avoid the hospital out-patient department, and prefer either the local health authority or voluntary clinic, or their general practitioner. The advantage to the community resulting from the employment of general practitioners on a part-time basis at local health authority clinics for family planning is obvious.

With regard to infertile marriages the position is very different. Modern investigation and treatment of infertility is a complicated procedure involving elaborate pathological investigations and specialized treatment. Most general practitioners, in consequence, refer their patients to clinics or to hospital out-patient departments after a preliminary survey.

Concerning the supply of contraceptive appliances, the opinion was unanimous, after careful consideration, that these should not be prescribed on the N.H.S. form E.C.10. Abuse of the supply on extravagant lines would follow easily. The free source of appliances might lead to lack of attention to fitting, and thus to a high failure rate, particularly in large urban practices where experience in technique, time, and chaperonage may all be in short supply. Necessitous cases have always received consideration at voluntary clinics, and the case that is urgent both on medical and on economic grounds can be supplied from the hospital out-patient department.

Payment

The question of payment for giving contraceptive advice naturally arises. It would seem reasonable that in areas where there is no local authority clinic a suitably qualified general practitioner should undertake this work and should be paid by the local authority. It is questionable whether the giving of contraceptive advice on purely social grounds, in the absence of any medical necessity, may be considered as coming under the heading of general medical services. It is suggested, therefore, that general practitioners who are prepared to undertake this kind of work should be entitled to collect a fee from the patient even though she may be on their list.

It is fully appreciated that there are large areas of the country (especially in urban districts) where women have no difficulty in obtaining the contraceptive advice they seek. There remain very many who find this difficult or impossible to obtain in the absence of accessible clinics or of a family doctor who has both experience and time to give to the matter.

Summary

The following recommendations are submitted as being passed by the council of the Medical Women's Federation:

1. The provision of facilities for family planning must be regarded as an integral part of the National Health Service. All local health authorities should be required to provide clinics for family planning, and these should be run jointly by the local health authority and the regional hospital board in view of the extensive investigation and treatment required for subfertility.

2. It is recommended that when use is made of existing voluntary clinics *adequate financial support* should be given.

3. Contraceptive appliances should not be included in the schedule of goods to be prescribed on form E.C.10 in any future scheme.

4. We recommend that advice on family planning should be available to women who require it on medical grounds, and also to women who ask for it for the purpose of family spacing. Such advice should be given by (a) local health authority clinics; (b) voluntary family planning clinics staffed by doctors; (c) gynaecologists in hospitals; and (d) general practitioners with special training and experience in this work who are willing to allot the time to it. These should be specially selected, and a panel of their names should be available locally. A fee for this service should be paid by the local health authority or, alternatively, by the patient.

Reports of Societies

TREATMENT OF HYPERTENSION

A meeting of the Section of Medicine of the Royal Society of Medicine was held at 1, Wimpole Street, on February 26, when medical treatment of hypertension was discussed.

Professor M. L. ROSENHEIM recalled that a similar meeting five years ago, on the therapy of hypertension, had been chiefly devoted to surgical treatment. He then reviewed the medical methods that have been developed in recent years.

There was no evidence that the prognosis of mild, symptom-free hypertension was improved by any form of therapy, and reassurance with mild sedation should continue to be employed. Continuous treatment was indicated in the more severe forms of essential and renal hypertension, in both the benign and malignant phases. Such treatment could be tolerated only by those in whom the symptomatic relief was sufficient to outweigh the discomforts and inconveniences of therapy. Cessation of treatment was invariably followed by a recurrence of hypertension and of symptoms.

Salt Restriction

The hypotensive effect of the low sodium diet, in which the daily salt intake must not exceed 0.5 g. (200 mg. sodium), had fallen into disuse in the past owing both to inadequate salt restriction and to the monotony of the diet. The hypotensive action of the rice diet was due to its low salt content, and the claims of Kempner have been confirmed in a Medical Research Council trial: 70% of the cases investigated had described symptomatic relief; in addition, improvement of retinopathies and regression of electrocardiographic changes had been noted. Salt restriction was contraindicated in the presence of renal failure owing to the persistent sodium loss from the diseased kidney which might result in a severe hyponatraemia. The low sodium diet was rarely practicable for patients outside hospital owing to the difficulty of preparing it at home.

Medical Sympathectomy with Methonium Compounds

Various drugs had been used to induce a medical sympathectomy. Of these ganglion-blocking agents, hexamethonium was the most effective. Tetraethylammonium bromide had too transient an action, and "priscol" had little hypotensive effect. Hexamethonium blocked both the sympathetic and parasympathetic ganglia; the former action caused hypotension, but the latter gave rise to various undesirable effects such as impairment of visual accommodation and dryness of the mouth. Constipation and abdominal distension also might occur, but they responded to neostigmine. Postural hypotension must not be confused with these side-effects, as it was an indication of effective therapy. In the presence of diseased cerebral or coronary arteries, the induction of sudden hypotension might cause thrombosis. Owing to poor absorption of hexamethonium from the gut, the oral dosage must be 10 times greater than that required by parenteral routes; if the bromide salt of the drug was used, bromism might result. In addition, irregular absorption might cause the sudden onset of side-effects. For these reasons subcutaneous administration was preferred. Hexamethonium was not metabolized, but was rapidly excreted by the kidneys. Should renal failure be present the drug must be given in small doses owing both to the reduced rate of excretion and to the danger of aggravating renal failure which would be shown by a further rise of blood urea. If renal function was normal, there appeared to be no danger of deterioration on prolonged administration of the drug.

The patient must be in hospital for the beginning of therapy. An initial dose of 25 mg. of hexamethonium

bromide was given by either intramuscular or intravenous routes; and, if the hypotensive effect was satisfactory, treatment commenced with a dosage of 25 mg. subcutaneously three times daily. Following each injection, the patient usually preferred to remain lying for an hour in order to avoid the effects of postural hypotension, but was otherwise encouraged to be up. Thereafter the efficacy of the drug was assessed by measuring the blood pressure two to three hours after the injection, with the patient in the recumbent and standing positions. Tolerance usually developed early, necessitating an increased dosage, and within two to three weeks the satisfactory maintenance dose was apparent: as much as 750 mg. daily might be required in some cases. The patient was then discharged to administer his own injections, and periodic observations were made thereafter to assess the efficacy of the dosage. The three injections of hexamethonium daily increased the lability of the blood pressure and were not intended to maintain a constant degree of hypotension throughout the 24 hours.

Symptomatic relief was marked, with the disappearance of headaches, dizziness, and nocturnal dyspnoea. Cases had been treated for as long as 15 months, but it was too early as yet to compare the results with those obtained by surgery. Hexamethonium was certainly not the ideal hypotensive agent, but was preferable to the low sodium diet.

Veriloid

Dr. R. KAUNTZE described his observations on the hypotensive effects of "veriloid," a stable reproducible mixture of alkaloids derived from *Veratrum viride*. The drug acted directly upon the afferent branches of the vagus and the central nervous system, giving rise to dilatation of arterioles in muscles, skin, and the splanchnic area, and constriction of the veins. The resulting hypotension could be reversed by ephedrine intramuscularly. Other actions were bradycardia of vagal origin, which was abolished by atropine, and emesis; the latter might be primarily central or follow the hypotension.

Intravenous infusion of veriloid (1 µg./kg. body weight/minute) for 10 minutes lowered the blood pressure in almost all cases of hypertension, except those in the preterminal malignant phase. Intravenous therapy was useful in hypertensive encephalopathy, but otherwise all patients were maintained on oral treatment. By mouth the maximal hypotensive effect was apparent three to five hours after ingestion. Three or four doses daily were employed, starting with 8 mg. divided equally, spaced at not less than four and a half hours and taken after meals to minimize toxic effects, the chief of which were substernal burning, salivation, hiccup, nausea, recurrent vomiting, and peripheral circulatory collapse. The combination of phenobarbitone with veriloid had been effective in reducing nausea and vomiting. The dosage might need frequent adjustment.

About 60% of hypertensives responded to veriloid orally, but in half of these the therapeutic and toxic levels were so close that the drug could not conveniently be used out of hospital. Thus there remained 30% who responded well to out-patient treatment, but in these the disease appeared to progress, although the tempo might be slowed. The pure alkaloid germitrine was similar in action to veriloid and the nausea proportionately no less.

Mechanism of Postural Hypotension with Methonium

Professor J. MCMICHAEL described investigations which explained the mechanism of postural hypotension caused by hexamethonium. In the normal subject, change of posture from the horizontal to the upright position was associated with a fall in cardiac output, which elicited reflex vasoconstriction to maintain the mean blood pressure. Under the influence of hexamethonium, standing caused the same reduction of cardiac output, but reflex vasoconstriction did

not occur, and a profound fall in blood pressure ensued. The effects of this drug, given by injection, on a series of cases was described. Of seven patients with malignant hypertension, three in whom treatment had been begun late had died, but four were now under good control and back at work. Of 27 cases of complicated benign hypertension, 7 had stopped treatment for various reasons, and 18 had responded satisfactorily with objective and subjective improvement. The usefulness of the drug in renal hypertension was also emphasized.

Preparations and Appliances

MUCUS EXTRACTOR FOR USE ON THE NEWBORN INFANT

Mr. H. H. FOURACRE BARNES, gynaecological surgeon, Hospital for Women, Soho Square, W.1, writes: The disadvantages of the ordinary mucus evacuator used for clearing the upper respiratory passages of the newborn infant are: (1) Aspiration of the mucus into the mouth of the attendant, since mouth suction is used. (2) To avoid this contamination of the mouth the attendant often blows out the mucus on to a towel so as to empty the reservoir of the evacuator. By so doing there is the obvious risk of the attendant's nasopharyngeal organisms reaching the end of the evacuator which is to be replaced into the infant's nasopharynx. (3) When using the ordinary mucus evacuator the attendant has to disarrange his face-mask to place the sucking end into his mouth. On occasion this may not be as easy as one would like, and contamination of the gloved hands by the mask may occur.

In order to avoid these disadvantages the mucus extractor shown in the diagram has been made for me, by Messrs. John Bell and Croyden, Ltd. The reservoir has a capacity

of approximately 20 ml. It consists of a hollow cylinder with two ends which screw on to form airtight joints. A tube passes through the centre of each of these ends, and in the interior of the cylinder the tubes curve away from each other to form a simple trap device which prevents mucus passing over into the suction mechanism. The distal curved tube is continuous with the cannula to the infant, and the proximal one is continuous with a screw joint for the valve. The suction is produced by a rubber bulb working in conjunction with a small double-ball-valve mechanism. When the bulb is compressed, air passes out of the outlet holes at the top of the valve, and on reinflation it sucks air through the reservoir. The end of the extractor which is to be inserted into the nasopharynx of the infant is covered with rubber tubing, which projects $\frac{1}{2}$ in. (1.25 cm.) beyond the end of the metal. This minimizes the trauma to the mucous membrane. The whole instrument can be held and worked with one hand. It can be wet-heat sterilized, the usual precaution being taken to prevent contact between metal and the surface of the rubber bulb.

The instrument consists of five separate parts—namely, cannula and distal end of reservoir, cylinder, proximal end of reservoir, the valve (which is itself in two parts), and the rubber bulb. It can therefore be cleaned easily.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

Doctors' Opinions in Lay Press

SIR,—A number of letters and articles by medical practitioners have appeared in the lay press recently which have attacked or criticized, sometimes with considerable rancour, other sections of the profession. Many of these statements can have done nothing but harm to the general standing of the profession with the public, and it is regrettable that they should have ever been sent for publication.

If a doctor wishes to ventilate a grievance or expound his views on some controversial point, it would be wise for him to do so in such a manner as not to bring his professional colleagues into disrepute. If reflections cannot be avoided, lay journals are not the appropriate place nor lay readers a suitable audience for such matters. The correspondence columns of the medical press are always open to him, and it is there, where any doctor's statements can be checked and if necessary corrected by his professional equals, that such statements should appear.—I am, etc.,

JOHN THWAITES,
Chairman, Central Ethical Committee,
British Medical Association.

Treatment of Anaemia

SIR,—I was dismayed to read the letter of Dr. S. Shubsachs (February 23, p. 437), who suggests that there is some merit in adding folic acid to iron pills. No controlled clinical studies are available to show that folic acid is of value in the treatment of iron-deficiency anaemia, and if patients are suffering from pernicious anaemia unknown to their practitioner the haematological picture may be so obscured by the prescription of iron or vitamin pills containing folic acid that the subsequent diagnosis of the patient's disorder may be rendered at least temporarily impossible. Moreover, since folic acid does not prevent the neurological complications of pernicious anaemia, the patient may report to his doctor on account of the symptoms of subacute degeneration of the cord without anaemia. Instances of this nature have already occurred where pernicious anaemia patients who did not know that they suffered from the disorder made a regular habit of eating vitamin pills containing folic acid. Quite apart from the inherent dangers of prescribing such preparations it should be realized that the ordinary ferrous sulphate preparations cost less than 2s. per 100, whereas one of the popular preparations containing folic acid costs more than £1 per 100.

I was interested, too, to read the excellent article by Drs. Nancy Benstead and G. W. Theobald (February 23, p. 407), in which they show no better haematological results from ferrous sulphate tablets containing molybdenum than from those without it. So far as toleration of molybdenized ferrous sulphate is concerned, the following note may be of interest.

In 1948 Messrs. Glaxo kindly prepared for me some tablets of ferri. sulph. co., each of which contained, in addition to the usual ingredients, 3 mg. molybdenum sesquioxide. These tablets were white. Like Drs. Benstead and Theobald, I found that patients who could not tolerate "fersolate" tablets on account of alimentary disturbances were able to tolerate the ones containing molybdenum. I then asked Messrs. Glaxo to provide tablets identical with fersolate but coloured white. These tablets were given to 16 patients who were quite certain that they could not tolerate fersolate, and in 14 of these patients, more than half of whom were in hospital, the white tablets that were otherwise identical with fersolate were tolerated without difficulty. No alteration was made in dosage. The colouring matter added to fersolate tablets is an aniline dye used in the strength of 240, gr.

to 600,000 tablets, and it can hardly be held responsible for the symptoms of intolerance of which the patients complained. It is difficult to see how the difference in tolerance can be due to anything other than psychological causes.

—I am, etc.,
Edinburgh.

R. H. GIRDWOOD.

SIR,—In their interesting survey of doctors' prescriptions (February 9, p. 292) Professor D. M. Dunlop and his colleagues refer to "shot-gun" preparations of iron, with folic acid, liver, or hog's stomach. They add the comforting statement that these combinations of substances are prescribed only rarely, though it is possible that analysis of "private" prescriptions might reveal a higher proportion.

Dr. S. Shubsachs (February 23, p. 437) and Dr. W. N. Leak (March 1, p. 484) infer that patients with iron-deficiency anaemias improve more rapidly when iron is administered together with folic acid. Since they do not offer any proof, one can only hope that their remarks are not indicative of a widespread prejudice in favour of such blunderbuss "haematinics."

No doubt the travellers in these commodities are very persuasive, and the attractive titles of the preparations suggest a benefit greater than that to be expected from time-honoured remedies, while the prescriber may be influenced by the common fallacy of confusing expense with value.

Whatever the reasons for their continued though, one hopes, limited use, I feel that it is time for the positive disadvantages of such preparations to be pointed out.

1. They obscure diagnosis. Since the preparations contain several substances, each of which would be capable, in adequate dosage, of curing different types of anaemia, the incentive towards making a correct diagnosis is lacking. If a temporary improvement, often called a "cure," results, the nature of the original anaemia remains obscure. In the case of pernicious anaemia even after discontinuing treatment the blood picture may be misleading for a considerable time, and both patient and doctor be lulled into a sense of false security.

2. The dosage of each of the constituents is inadequate to produce good results (with the possible exception of iron). The quantities of liver, yeast, and hog's stomach are too small to be of any therapeutic value, and their inclusion must be regarded simply as groundbait, whereas the inclusion of folic acid is positively dangerous. Patients suffering from pernicious anaemia and partially treated with folic acid are exposed, in a small proportion of cases, to the real risk of developing subacute combined degeneration of the cord.

3. These preparations are expensive. Iron-deficiency anaemias, that is, the only anaemias in which such combinations of substances can be given with safety, or with anything approaching adequate effect, are curable by cheaper and better methods.

—I am, etc.,
Bristol.

J. NAISH.

What Doctors Prescribe

SIR,—The original article (February 9, p. 292) and subsequent letters have made thoroughly worth-while reading. Particularly those of Professor Dunlop, and the findings of the general practitioners, show a hope of future co-operation. Were a professional panel to produce annually, at the Ministry of Health's expense, a supplement of new drugs of proved worth therapeutically and economically for distribution to general practitioners, these gentlemen would be spared much anxiety and time, the State much expense.

I submit that the idea is not original. Its initial limited application to one of Professor Dunlop's areas would be ideal to test its practical value.

Subsequent alteration in prescription costs for the area could be readily seen. More important still, the general practitioner's constructive criticism would be available.—I am, etc.,

London, S.W.3.

D. D. MACDONALD.

SIR,—Professor Robert Platt's remark about his "healthy contempt for most of the pharmacopoeia" of 1920 (March 1, p. 484), and the article by Professor D. M. Dunlop and others (February 9, p. 292), raise problems which have been

discussed repeatedly in this *Journal*. The understanding and treatment of organic diseases have progressed rapidly. We have powerful drugs and we can therefore afford to discard many pharmacological substances, the use of which could be excused as long as we had nothing better to offer to our patients. Yet many teachers of pharmacology continue to teach the use of outmoded drugs, and the students have to learn them. Most students are so impressed by the progress in the treatment of diseases that they are insufficiently prepared when in general practice they are called upon to treat patients who suffer from minor ailments which one does not often see in hospital and for many of which there is no treatment. In particular does the young doctor find it difficult to wean his patients—on whom he is financially dependent—from the use of drugs which are of no value.

While many illnesses have been wiped out or can be cured when they occur, the number of patients consulting doctors in general practice has not decreased. More and more we are coming to realize that the complaints of many patients can be properly understood only in terms of psychosomatic medicine, and most of these cannot be cured by the physical remedies at our disposal. Yet we are still inclined to behave as if the patients' illusion that health in all its aspects can be bought in the shape of a bottle of medicine or a tablet is correct.—I am, etc.,

Stockport.

A. MODEL.

SIR,—The ability to assess the value of a drug requires accurate observation, intelligent interpretation, and unbiased judgment. Our profession is well trained in the first two faculties, and is above the average in the third, but then the average is deplorable. That truly objective judgment is a rarity in man, and virtually non-existent in women, can be seen by considering the variety of opinions one hears expressed on certain standard subjects.

The public's attitude towards medicines is more akin to superstition than to reason, and that this is true for all educational levels shows that education as we know it is not enough. My brother, a bachelor of laws and a solid citizen in other respects, attributes his relative freedom from colds this winter to his daily ingestion of a halibut-liver-oil capsule, despite the fact that his diet is in no way deficient. I have several patients who return year after year for anti-catarthal vaccine, which they are convinced raises their immunity to colds; and yet controlled experiments in industry and the Services have proved that dummy injections are as effective. A doctor friend avidly consumes all his own samples of multivitamin capsules, and as many of mine as he can lay his hands on. The fact that his wife and children enjoy as good health as he, although denied these dietary embellishments, appears irrelevant.

Every child after the age of 5 should be imbued with a spirit of analytical scepticism, and training in objective judgment should be given a permanent place in school curricula.

Until such time as the public and, much more, the doctors have learned to take a more rational view of pill-swallowing, may I suggest that here is a fertile field for State enterprise? What is wanted is a small range of capsules in a variety of bright colours, and composed of some inert substance. The vast quantities required would enable them to be produced at negligible cost, perhaps 3d. per 100, and an additional advantage would be that their inert composition would render their exhibition less fraught with incidental hazards such as the gastric upsets and idiosyncrasies occasionally encountered in orthodox therapy. The range of colours would cover all common indications, and doctors would prescribe them in all cases in which no clear indication for drug treatment existed. The name of the preparation desired by the patient would be written out in full, followed by some agreed appellation to denote the dummy preparation.—I am, etc.,

Bridge of Weir, Renfrewshire.

MUNGO B. HAY.

SIR,—Two points arise from the letter of Dr. Frewen Moor (February 23, p. 436). First, I also have felt this difficulty in ordering proprietary drugs because I cannot remember the pharmacopoeial equivalent. However, my attention was drawn to the *Index of Modern Remedies* (Mair, 1950, price 5s., published by *The Scottish Chemist*). This is easily accommodated in a doctor's bag and gives full lists of even the most recent proprietary drugs with their presumed action, forms of packing, pharmacopoeial equivalent, and in many cases also the price.

Secondly, with regard to his continuous colds, I presume Dr. Moor has had his sinuses examined. My personal experience is that this was the fundamental cause of such colds.—I am, etc.,

Ayr.

W. O. G. TAYLOR.

Test for Anaemia

SIR,—I have seen a good deal of correspondence in the *Journal* lately about anaemia. It is very difficult for a busy G.P. to test the haemoglobin; he has not the time even if he has the instrument and ability. I have been a G.P. for over 40 years, and I know that very few G.P.s do test the haemoglobin. The following clinical test does not seem to be well known—it takes no time or trouble.

Give 30 gr. (2 g.) ferri et ammon. citr. thrice daily after meals. If this does not constipate much or even causes some diarrhoea the patient is anaemic and the iron will do good; if it constipates to the point of marked inconvenience she is probably not anaemic. A very simple test, it can do no harm and is right in 80% or 90% of cases. Sometimes ferri et ammon. citr. causes diarrhoea; if so, add liq. morph. 4 or 5 minims (0.3 ml.) to each dose. Tablets of ferri sulph. exsic. are of no use for this test.

I have used this test for over 20 years and found it most useful in the common anaemia of pregnancy and other anaemias. I discovered this about 20 years ago when I got anaemic and took ferri et ammon. citr., and to my surprise found that it cured my constipation, from which I had suffered nearly all my life.—I am, etc.,

Limpfield.

G. D. LAING.

Salivary Tumour of the Hard Palate

SIR,—With reference to the letter by Dr. A. T. H. Glanvill and Mr. B. Martyr entitled "Interesting Tumour of the Palate" (February 9, p. 329), the following account of a tumour of the hard palate should prove of interest.

A woman aged 62 had a three-years history of a swelling in the hard palate, causing no pain, only discomfort. The swelling, $2\frac{1}{2}$ by 2 cm., was sessile, circumscribed and broad-based, softish in consistence, and there were no glands. Under gas and air the tumour was removed without difficulty in March, 1950. It had slightly eroded the hard palate. The incision was closed by sutures and compression applied. The patient made an uneventful recovery and there has been no recurrence so far. The pathological report was: "Section shows typical mixed tumour of salivary gland type with mucoid change in the stroma. There is no evidence of malignancy, but, as in their salivary counterparts, local recurrence is a possibility."

On looking up the literature I found that in reports of 419 salivary tumours 23 (about 5½%) were in the palate.—I am, etc.,

London, W.1.

ARTHUR MILLER.

Shortage of X-ray Films

SIR,—After your masterly leading article (January 12, p. 94) and the letters of your contributors I think we may now safely surmise that there will always—in our time—be a shortage of x-ray film. Demand for film can, and must therefore, be reduced.

In the last thirty years many devices have been used successfully in radiography in which expensive double-coated film is not needed. There was no real need in the spacious days to use these devices regularly. In my own limited experience I saw the development of pin-hole minia-

'... Greater use might be made of penicillin by mouth . . . This method is suitable for adults as well as for babies and older children, and it is particularly convenient in general practice; its wider adoption would 'save doctors' and nurses' time and hospital beds, besides lessening the patient's discomfort.'

EDITORIAL (1951) *Lancet*, i, 725

ESKACILLIN 50 presents crystalline potassium penicillin G in a

pleasantly flavoured aqueous vehicle — the ideal form for

oral administration. The aqueous vehicle is buffered so that **ESKACILLIN 50**

retains its potency for at least seven days after it has been dispensed.

ESKACILLIN 50 is available — on prescription only

— in 2 fl. oz. bottles, each containing 800,000

I.U. crystalline potassium penicillin G. Each medical

teaspoonful (1 fluid dram) contains 50,000 I.U. penicillin.

Aspirin tablets made soluble and palatable. A successful approach to a difficult problem.

It has long been known that aspirin, being an acid substance of low solubility, may act as an irritant to the gastric mucosa, producing inflammatory changes which may cause symptoms of dyspepsia. In massive dosage, or even in moderate dosage over a prolonged period, it may also, because of its acidity, encroach upon the alkali reserve. 'Solprin' tablets provide aspirin in a substantially neutral, stable, soluble and palatable form.

The therapeutic advantages of calcium aspirin over aspirin have long been stressed in medical literature.

Aspirin is an acid substance only slightly soluble, and often behaving as a potential gastric irritant. Calcium aspirin, when free from decomposition products is neutral, highly soluble and bland.

Unfortunately, however, calcium aspirin is unstable. The reaction by which it is produced is reversible, and the compound thus becomes increasingly contaminated with nauseous breakdown products, chiefly acetic and salicylic acids.

The difficult problem of the preparation of calcium aspirin in stable and palatable tablet form has now been solved. Solprin embodies all the virtues of aspirin, but is free from the above defects of this valuable analgesic and those of calcium aspirin as ordinarily available. When placed in water, Solprin tablets yield a solution of calcium aspirin which is substantially neutral and palatable.

S O L P R I N REGD.

Stable, soluble, palatable calcium aspirin

Clinical sample and literature supplied on application. Solprin is not advertised to the public and is available only on prescription. (U.K. and Northern Ireland only). It is not subject to Purchase Tax, and when prescribed costs actually less than 1d. for three tablets.

ture exposures from the actinic fluorescence of a screen in the middle twenties, and the use of bromide paper in the traumatic surgery of the Palestine fracas of 1935-7.

At the present time the greatest demand for large film is from tuberculosis clinics. In the last few years tuberculosis practitioners have come to rely solely on x-ray findings for both diagnosis and progress. It is my contention that the use of full-size film is not in all these cases justified. The original diagnosis may well be on the usual 15 by 12 film. The follow-up, the hordes of contacts, spread over a year or more, in most cases, are surely the case for which "mass miniature" came into being. The mobile mass miniature is nowadays but a bus-ride away in most regions.

Casualty and fracture work is efficiently performed on bromide paper, as is follow-up work in orthopaedics; one late film is all that is required in salpingography. In the majority of cases in barium meals, a serial-changer at the radiologist's screening session will give a concrete diagnosis, in good hands, on one film. One tomograph film, after a moment's thought, is as good as all the routine films at blunderbuss levels, in thick structures for which this technique was introduced. I submit that economy should not yet be applied to procedures which still show room for improvement. I instance cholecystography, pyelography, arteriography, and skull work. The amount of film likely to be used for these is trivial. A camera adaptation has been devised in my area which will have the approval of even the most financially embarrassed management committee. Its cost is a bagatelle, its upkeep is that of an amateur's camera, and its construction is within the scope of the hospital handyman. The details will shortly appear in the radiographers' technical journal, for anyone who may be interested.—I am, etc.,

West Norfolk.

G. E. CHURCH.

Sterilization of Woollen Fabrics

SIR,—With reference to Dr. H. F. Barnard's paper on the sterilization of woollen fabrics (January 5, p. 21), I can confirm his findings regarding hypochlorite treatment of blankets not being adequately bactericidal. In tests carried out over a period of three months at a hospital laundry it was found that when blankets were washed with soap in the normal way the wash liquors and rinse waters soon became heavily contaminated. Starting with uninfected water and washing one load of 30 blankets, the total bacterial count of the wash liquor was of the order of 1,000,000 organisms per ml. with presumptive coliforms present in 0.01 ml. Next, sodium hypochlorite was added to the wash liquor to give 200 p.p.m. available chlorine together with a synthetic detergent in place of soap, and another load of used hospital blankets washed. Over a period of time only a slight improvement bacteriologically, as compared with results from normal soap washes, was noted. In a matter of seconds the hypochlorite reacts with the wool protein, and there is no available chlorine present to kill micro-organisms.

In direct contrast to this, quaternary ammonium compounds (Q.A.C.), as pointed out by Dr. Barnard, retain their germicidal properties when adsorbed on to woollen fibres, at the same time controlling infection in the wash and rinse liquors. Many types of Q.A.C. can be shown to be effective. An example is

tetra decylpyridinium bromide; when adsorbed on to hospital blanket fibres its growth-inhibitory action against *Staph. aureus* can be clearly shown (see Fig.). For practical purposes it is important to remember that if blankets are first washed with soap, as is the common practice, then the bactericidal efficiency of any subsequent

Q.A.C. disinfectant rinse will be reduced because the Q.A.C. will to some extent be neutralized by the soap residues in the fabric.

To effect economy in practice it is advisable to use a non-ionic detergent in place of soap. The Q.A.C. treatment may then be applied in the final rinse. Dosage will depend on the weight of blanket fabric washed, the type of Q.A.C. used, and to some extent on the mode of washing. Although the process is perfectly simple it is wise to seek expert advice in the first place and later institute bacteriological control at the hospital laboratory on blanket fibres, wash liquor, and rinses.—I am, etc.,

London, W.1.

CHRISTINA M. COUSINS.

A.C.T.H. and Cortisone in Leprosy

SIR,—I have read with great interest your leading article "Cortisone and Tuberculosis" (December 29, 1951, p. 1570), in which you discuss the action of A.C.T.H. and cortisone in tuberculosis, and the difficulties and dangers attending their use in this disease.

I have recently been studying the action of A.C.T.H. and cortisone in the sister disease, leprosy, in which the same relief of symptoms attends the use of these hormones, but in which also their use is attended with difficulties and dangers. The following is a brief extract from a summary report on this subject.

Knowledge of leprosy and its complications ("reaction," acute neuritis, acute eye inflammation, etc.), and of A.C.T.H. and cortisone and their mode of action in other diseases, suggests that these hormones might relieve the acute symptoms of leprosy, which can be very troublesome, but they are not likely to benefit the leprosy itself, and might even aggravate it by diminishing or abolishing the tissue reaction which keeps the disease in check. If these expectations are fulfilled the question arises whether by careful regulation of dose, and by continued or intensified chemotherapy given at the same time, it might be possible to secure the good effects of hormone treatment and avoid the bad ones.

Trials of A.C.T.H. and cortisone in the acute and subacute complications of leprosy have been carried out here. Thirty-eight such cases have been treated and studied during a period of four months.

In all cases the immediate response to treatment has been excellent. Severe "reaction," acute neuritis, and severe eye inflammation have been relieved within a day or two. The cessation of treatment has, however, been far too often followed by a recurrence of the symptoms, and also by the development of other complications, and further treatment has given only temporary relief, followed by complications becoming more severe and more frequent, and definitely indicating an aggravation of the leprosy. All attempts by modification of dosage to prevent this deterioration have failed, and the conclusion is that, in general, the use of these hormones is contraindicated in leprosy.

There are, however, two ways in which these hormones are of great value in leprosy. In sulphone sensitization, with drug fever, dermatitis, hepatitis, etc., which may be so severe as to endanger life, a three-day course of A.C.T.H. or cortisone is enough to set the patient well on the way to recovery, although occasionally a second course is needed; in leprosy eye inflammation the local use of cortisone in the form of eye drops appears to be of great value in preventing serious damage and possibly blindness. Neither of these procedures has been followed by an exacerbation of the leprosy process. A report is in preparation.

—I am, etc.,

Uzuakoli, E. Nigeria.

JOHN LOWE.

Cortisone in Rheumatism

SIR,—Dealing with the complications of cortisone therapy Dr. W. S. C. Copeman and his colleagues in their paper (February 23, p. 397) say: "The preoccupation of many observers with these mild side-effects reminds one of a house-proud woman overconscious of a speck of dust which the visitor has not noticed." Many readers, I feel sure, will disagree with their estimate of the importance of these side-effects. Intestinal perforation and haemorrhage, hypertension, and glycosuria, sodium retention and potassium depletion, the development of a modified Cushing's syndrome

—All these add up to more than a speck of dust. It is, however, with the significance of the complications rather than their severity that I am concerned.

Very often a study of the side-effects of certain forms of therapy reveals a lot about the mechanism of the disease under consideration. I have not myself introduced any form of drastic treatment in disease, but I have witnessed the effects of some heroic, not to say peculiar, forms of therapy in leprosy and rheumatism. A recession of lesions in leprosy—cure of a kind—followed such treatment as intravenous tinned milk, intravenous sodium salicylate, intravenous dyes and chemicals of uncertain constitution, potassium iodide in doses of half an ounce daily, and so on. The author who introduced intravenous tinned milk observed that the patient complained of precordial pain and often collapsed on the roadside where the injection was given. His relatives picked him up and took him home and noticed the recession of lesions in due course. At a recent meeting of the Royal Society of Tropical Medicine and Hygiene at which leprosy was discussed the favourable effects of A.C.T.H. on lepra reaction were mentioned, but I was disappointed to note that there was not a single reference to dye therapy or tinned milk. Really there is no need for authors to blush at the mention of previous drastic treatments in leprosy or rheumatism. The original findings, published in all sincerity, were correct. It often happens that subsequent observers emasculate the therapy in their efforts to avoid toxic effects and so it falls into disuse. But this does not mean that the original therapy did not produce a recession of lesions as well as side-effects. Instead of trying to write down or minimize the value of the complications in each case it would be more profitable to inquire what cortisone and tinned milk have in common.

Before the advent of cortisone I was able to show (*Ann. rheum. Dis.*, 1942, 3, 89) that all the agents which effected cure in leprosy and rheumatism had some debilitating or toxic effect. We can easily recognize it in a long list of agents known to produce cure or recession of lesions—for example, gold and heavy metal therapy, pregnancy, major operations, toxic and infective hepatitis, and, recently, hypoglycaemia in rheumatism; malaria in general paralysis; hypoglycaemia, electroconvulsive therapy, and leucotomy in schizophrenia; pregnancy, prolonged arsenical therapy, and hypervitaminosis D in psoriasis.

The inflammatory reaction which is the basis of rheumatism and leprosy, and the behavioural reactions of schizophrenia, are dynamic in nature. What is more natural than that they should be toned down or suppressed in circumstances of debility or trauma? We may be deluding ourselves in trying to believe that cortisone has some mysterious endocrinological effect which rights what is wrong in rheumatism and that the side-effects are unfortunate accidents to be eliminated by further experience.

In Dr. Copeman's series nearly half the patients showed some obvious manifestations of hyperadrenalism. The side-effects were reversible, and so, for that matter, was the cure. Other authors have described the same phenomenon, and Sprague (*Amer. J. Med.*, 1951, 10, 567) goes so far as to say: "... A state of hormonal excess of some degree must be established before a favourable clinical effect can be achieved." When authors record that in a given case the drug had to be discontinued because of side-effects and that relapse followed, they also imply that so long as there was a state of hyperadrenalism there was no rheumatism. There is no evidence of adrenal or pancreatic deficiency in rheumatism any more than there is evidence of vitamin-D deficiency in lupus vulgaris. Cure in these diseases is associated with hyperadrenalism or hyperinsulinism and hypervitaminosis D respectively.

We have, therefore, to consider two propositions. Cortisone cures rheumatism and it produces profound alterations in metabolism; or cortisone cures rheumatism *because* it produces profound alterations in metabolism. The first proposition might reduce the value of the side-effects to a speck of dust. The second brings out their true significance. The cortisone therapy of rheumatism may be more elegant than the tinned-milk treatment of leprosy, but the same factor of debility is quite evident in both.—I am, etc.,

Bristol

WILLIAM HUGHES.

SIR,—The report by Dr. W. S. C. Copeman and others (February 23, p. 397) is the most objective and helpful paper published in this country. One expression, however, I would cavil at, the use of the phrase "suppression of symptoms." Surely the arrest of fibroblastic activity and the associated diminution in joint swellings are indicative

not merely of symptomatic suppression but of actual therapeutic value, either of cortisone itself or of its power to liberate the repair mechanisms of the body?—I am, etc.,

Sunderland.

W. GRANT WAUGH.

Critique of Therapy in Rheumatoid Arthritis

SIR,—The tragic effect of premature publicity on true scientific advance is now nearly complete with the publication of Dr. J. J. R. Duthie's report on "Rheumatic Diseases in the U.S.A." (February 16, p. 341), and so it may be opportune to review briefly the unscientific and often puerile attempts made during the last few years to explain these diseases and the results of steroid treatment by theories which could not be upheld, except by ignoring a wealth of knowledge already verified by past experience. That such a review is necessary I have no doubt, since it is possible that a new therapeutic attack is imminent which, based as it is upon a theory at present unsubstantiated by adequate data, has already led to trial treatment by one of the newer antibiotics with "suggestive" results.

Prior to his paper (*Proc. Mayo Clin.*, 1949, 24, 181), Hench had expressed the opinion that the pathological changes in rheumatoid arthritis were reversible, basing this view upon the amelioration which often takes place during pregnancy and infective hepatitis. That such improvement takes place is common knowledge, but it is equally true that the disease again advances when the physiological or infective process comes to an end. The same sequence of events occurs in psoriasis, but it is not so widely reported that these diseases may in fact deteriorate, and I have personally observed cases of rheumatoid arthritis and psoriasis in which signs and symptoms were *aggravated* by pregnancy. It is hardly necessary to point out that the scaly patches on the skin in psoriasis are a sign of the disease and not the disease process itself. This distinction is important, since the disappearance of these patches merely removes a sign, leaving the dynamic cause completely unaffected.

The easy acceptance of reversibility, coupled with the dramatic effects of cortisone, led to the belief that the problem of rheumatoid arthritis was near final solution. Selye's work, the importance of which has been obscured by the many and vain attempts made to twist its findings to explain the action of A.C.T.H. and cortisone, led to the popularity of the word "stress" for the aetiological agent. I found it very difficult to get a definition of this term stress, but after much discussion it appeared that "any noxious stimulus" could under certain circumstances fill the bill, with the result that really anything harmful could cause rheumatoid arthritis. Was the popularity of the word due to the fact that it could mean all things to all men—i.e., psychological to the psychiatrist, infective to the bacteriologist, etc.?

But, even so, there were difficulties, since it afforded me no explanation of the fact that rheumatoid arthritis is primarily a disease of women, and I felt that it was carrying feminism too far to believe that they are exposed to the action of stress more than their male counterpart. Again, the ready dismissal of a specific infective agent was difficult to understand, since rheumatoid arthritis carries so many facets pointing to infection. The fact that no such agent has been discovered even after many years of patient research militates not one jot against such an explanation.

Rapidly the picture took shape as cortisone and A.C.T.H. were found to have effects on many other diseases, and so the "collagen group" became the convenient pigeonhole for many of our obscure disease problems, which, although having some common pathological features, nevertheless are quite distinct in their clinical signs and symptoms.

Now and then during the past few years some were heard questioning the basis on which all this superstructure was built, but the chorus of enthusiastic followers of cortisone therapy (swelled from time to time by "fellow travellers" with useless reports on the efficacy of related steroids) denied them a hearing until now, when after a few years' experience with this substance it is realized that the problem of rheumatoid arthritis is as obscure as ever.

I think it will be admitted that after an unbiased perusal of Duthie's report we may conclude that cortisone and A.C.T.H. have no effect whatever on the cause of rheumatoid arthritis.

They are powerful two-edged physiological weapons which can temporarily obscure the signs and symptoms of certain diseases (and incidentally, from another point of view, intercurrent disease), and repair is not a concomitant of the period during which signs and symptoms are suppressed.

Their use as a therapeutic agent is attended by grave dangers (now especially that cortisone can be dispensed in tablet form), and, since cessation of treatment is followed by relapse and often deterioration, restriction of their use is strongly indicated.

It appears that the "collagen group" may be on its way out, but, unfortunately for our patients, only as a term.

Finally, to point a moral, may I refer again to a portion of Duthie's report touched upon in my opening paragraph dealing with the work of Wickelhausen? This worker suggests that organisms of the pleuropneumonia-like group may act as the antigen in rheumatoid arthritis, and then on this assumption proceeds to use "terramycin" as a therapeutic agent. The clinical response to this therapy is listed under three headings: (1) gradual improvement, (2) reactivation after withdrawal of the drug, (3) severe exacerbation after a single dose, thought to be due to the destruction of the organism with the release of antigenic material. Here we have the ingredients of another muddled pie of "suggestive" trials, and I fear that soon a new wave of enthusiasm for this new therapy may develop, leading to numerous papers showing masses of statistically significant results of cure, near-cure, and improvement. Therefore let it be stated now categorically that as yet the role of the pleuropneumonia-like group of organisms in disease is unknown and that they cannot be identified with any particular disease process. Any suggestion, therefore, that clinical observations following the use of terramycin in rheumatoid arthritis have the slightest value as evidence that these organisms have any aetiological significance, and any conclusions drawn therefrom, are completely unwarranted.

To condemn treatment by terramycin does not imply that I deny that the pleuropneumonia-like group can play an important role in rheumatoid arthritis. That they may do so is in my opinion possible, since these organisms have been often found in cases of so-called non-specific urethritis in the male, and when it is realized that in cases of this nature a rheumatoid-arthritis-like complication—especially in those following sexual exposure—is common the inference is obvious. Until, however, it is settled what role, if any, this group of organisms plays in the pathogenesis of disease, let us keep our theories as theories, since much disappointment will result from unfulfilled expectations of a therapy based on such flimsy grounds.—I am, etc.,

London, W.1.

F. L. LYDON.

Splenins A and B in Rheumatoid Arthritis

SIR,—May I pick a statistical bone with my good friends Drs. G. D. Kersley, D. Watson, and L. Mandel?

In their letter (February 23, p. 438) they write, "Our mean bleeding-time . . . was 97 seconds (S.D. ± 26 seconds, $n=95$). This is improper from the point of view of both purity of statistical thought and clarity of expression. Standard deviation (S.D.) "is a measure of the scatter of the observations around their mean" (Bradford Hill). It is measured in the same units as the observations and is a positive measurement. The $\pm$ sign after a mean is used to indicate the error of the mean, the standard error or the probable error. The error of the mean should not be loosely confused with the standard deviation of a set of observations. Later in the letter they write, "80 bleeding-times . . . gave a mean . . . for B 201 ± 58 ." The reader is left confused: does ± 58 refer to the error of the mean or the standard deviation?

These comments are not merely of academic interest but of practical importance. Let us examine the figures I have quoted, assuming that all figures after the $\pm$ sign refer to standard deviations. The problem is to decide: is the difference between the two means 201 and 97 seconds, that is 104 seconds, significant? The standard error of the difference may be calculated

from the formula $\sqrt{\frac{\sigma_1^2}{n_1} + \frac{\sigma_2^2}{n_2}}$, giving a value of 7 seconds.

The observer is at liberty to choose any level of significance he wishes. Twice the standard error is usually adopted, meaning the difference would occur by chance only once in every twenty trials. Thrice the standard error would be achieved by chance

only once in 370 trials. In the case we are considering the difference of the means is nearly 15 times its standard error. If the samples are regarded as too small for this treatment, Fisher's extension of Student's theorem to the comparison of two means could be applied and a precise measure of the probability of this difference occurring by chance made.

If these workers had had a clearer idea of what is meant by standard deviation and the error of a mean they would have been able to state not only that their results supported "to some extent" Ungar's figures, but to what extent in terms of probability, and saved themselves the labour of considering other methods of investigation. I am reminded of the teacher who asked the student, "What is the bleeding time?" and the student replied, "Five-thirty, plus or minus three minutes."

—I am, etc.,

Filmwell Kent.

GEOFFREY E. LOXTON.

SIR.—With reference to Dr. G. E. Loxton's criticism of our letter published in the *Journal* of February 23 (p. 438) we are well aware that S.D. is a measure of scatter and agree that it would have been more correct to repeat S.D. through the letter in place of the $\pm$. We purposely did not attempt to come to anything but negative conclusions, not because of our inability to work out the standard error, but because of our practical assessment of the method. While we recognize the essential value of statistical analysis of figures, we are of the opinion that the wrongful application of statistics to unsatisfactory experiments may apparently prove what is not true.—We are, etc.,

Treatment of Hypoprothrombinaemic Haemorrhage

SIR,—For many years it has been known that vitamin-K analogues correct the hypoprothrombinaemia associated with certain types of jaundice. The response in these cases is always more rapid when these water-soluble products are given intravenously. Drs. A. S. Douglas and Alexander Brown (February 23, p. 412) have investigated the action of vitamin-K preparations on the hypoprothrombinaemias induced by dicoumarol and "tromexan," and they suggest that vitamin K₁ (2-methyl-3-phytyl-1:4-naphthoquinone) is the only preparation which would act as a reliable antidote if a haemorrhage was to occur during treatment.

With proper laboratory control dicoumarin drug therapy should now be fairly free from haemorrhagic complications. This is no doubt the reason why these workers were unable to furnish us with an example of any such case treated with vitamin K₁. The vitamin is not easily obtained and the mode of administration advocated by them far from perfect. I refer in particular to the large volume of fluid (500 ml. 5% glucose containing 200–400 mg. vitamin K₁) and the length of time for its infusion—that is, 5½ hours.

Haemorrhagic complications during dicoumarin drug therapy are either moderately severe (haematuria, epistaxis) or very severe (cerebral haemorrhage, haemopericardium). The moderately severe cases clear up on withdrawing the drug and administering vitamin-K analogues intravenously. I reported such a case two years ago (*British Medical Journal*, 1950, I, 183).

The severe cases of haemorrhage are hopeless and they die in a matter of minutes or a few hours. Drs. Douglas and Brown are optimistic if they believe vitamin K₁ is going to save such cases.

Of all the cases which they treated, in their endeavour to prove the superiority of vitamin K₁ over the vitamin-K analogues, only two could be said to have prothrombin levels which I could consider in the danger zone. Both were on tromexan.

With tromexan there appears to be less need for anxiety until the prothrombin activity is below 10% of normal. I have records of several patients where this occurred, and, on withholding the drug for 24 hours without any vitamin-K

analogue being given the prothrombin activity was then found to be over 50%. The two cases alluded to would appear to have reacted in a similar way.

On the other hand, when patients on dicoumarol are found to have a prothrombin activity in the region of 10%, although no haemorrhage has occurred, I have found vitamin-K analogues of value. The dicoumarol is withheld and a small dose of one of these analogues given intravenously. This has always prevented a further fall in prothrombin activity, and in fact an increase to a level of about 20-30% is found next day. The dicoumarol treatment is then continued with carefully graded maintenance doses.

I am afraid the advantages predicted for vitamin K₁, alas, can be evaluated only when a case on dicoumarin drug therapy, complicated by a severe haemorrhage, is treated with this new antidote.—I am, etc.,

Habitual Abortion

SIR,—Dr. D. C. A. Bevis (February 23, p. 440) says, "I await with great interest the results of a series of patients treated by Drs. Bishop and Richards with the implantation of inert tablets." This presumably refers to the following sentence in our paper (February 2, p. 244): "There is of course an obvious way of settling the question whether a progesterone implant is endocrinologically or merely psychologically therapeutic—namely, to treat alternate cases with implants of progesterone and an inert compound such as cholesterol." We would like to point out that this does not mean that we intend to carry out this experiment—indeed, we do not. It is still our personal impression that a woman who has had two, three, or more previous "idiopathic" abortions before the end of the fifth month of pregnancy stands a better chance of bringing her next pregnancy to a successful termination if she receives a progesterone implant. Whether she stands this better chance because of the endocrinological, psychological, or any other effect of the implant is, to our mind, beside the point.

On the other hand, if there are gynaecologists who genuinely and sincerely believe that there is no treatment that improves the success rate in cases of habitual abortion they would, in our view, be doing a valuable piece of work by implanting alternate patients on the one hand with progesterone and on the other with an inert compound. We believe that this would provide a better index of the part played by psychotherapy (if any) than would be obtained by giving the patients no treatment whatever, as Dr. Bevis and your leader writer suggest. The person who conducted such a study would need to be endowed with an extremely forceful personality if, in these days when even the patient herself has been led to understand by hearsay that there is some kind of treatment for cases of habitual abortion, he can persuade the patient and her doctor that no treatment is better than, or at least as good as, some treatment and can ensure that the patient will not sneak off to another gynaecologist or undergo some form of treatment on the sly.

Even supposing such a strong-willed individual were successful in collecting this no-treatment series, could it be regarded as having satisfied the principles of random sampling and therefore reflect the true incidence of habitual abortion any more faithfully than the figures provided by Eastman and Malpas, about which your leader writer makes the criticism that "though Malpas's and Eastman's figures may have applied to the populations they were studying, they may not, nevertheless, have universal validity"?

It may turn out that the spontaneous cure rate is far higher than has been generally supposed, as your leader writer suggests, but we should be surprised if it becomes an established fact that 85% of women having had two consecutive idiopathic abortions before the end of the fifth month will bring their next pregnancy to a successful termination or that 72% of those who have had three or more consecutive abortions will produce a live baby as the result

of their next pregnancy. So long as we can achieve such results, however, following progesterone implantation, we shall consider ourselves morally obliged to continue implanting progesterone.—We are, etc.,

Intra-partum Uterine Rupture

SIR,—I have read with considerable interest the medical memorandum by Mr. Robert Hodgkinson (February 9, p. 308).

In a recent case, where rupture of a previous classical caesarean section scar occurred before the onset of labour, the patient was at her home in a state of extreme collapse, but blood transfusion of five pints (2.8 litres) of blood was undertaken over a period of two hours before she was moved. As a result of this her condition was sufficiently improved to make laparotomy and hysterectomy a comparatively safe procedure, and she made a very rapid and completely uneventful recovery.

The point I should like to make is that the firm contraction of the uterus which Mr. Hodgkinson mentions was so marked that the uterus was, in fact, turned inside out and complete haemostasis had been secured as a result of this. It would seem, therefore, that if this is a common finding in these patients there should be no question of rushing prematurely into operation, but that they should be retained where they are until adequate resuscitation has been carried out. The uterus, once it has emptied itself of its contents, is likely to arrest its bleeding spontaneously and will therefore allow ample time for transfusion before the patient is moved. It is the moving before resuscitation that is so often fatal in these cases, and attention to this point may do much to reduce the mortality of a very dangerous accident of pregnancy.—I am, etc.,

Worcester.

J. A. CHALMERS.

SIR,—Dr. T. F. Redman (February 23, p. 438) and I have no difference of opinion regarding the more serious nature of the spontaneous lower segment rupture as compared with rupture of the lower segment section scar. The latter is a herniation through fibrous tissue, self-limiting in extent—at any rate for some appreciable time—as was so patently shown in the paper by Drs. Dewhurst and Rowley (*J. Obs. Gynaec. Brit. Emp.*, 1951, 58, 630). The spontaneous rupture is a tearing and separation of muscle fibres, with no limiting boundaries in the uterus. The figures which I quoted in my article (February 9, p. 308) clearly prove that lower segment ruptures (as a group) are more serious than upper segment ruptures. A number of these cases of lower segment rupture do not reach the hospital, and are certified as deaths from obstetric shock, and not until all cases of maternal death are examined post mortem can the full extent of the problem be known.—I am, etc.,

Church Village,
near Pontypridd.

ROBERT HODKINSON.

SIR,—The following case history bears out Dr. T. F. Redman's comments (February 23, p. 438) on intra-partum rupture in a subsequent pregnancy of a previous lower uterine segment caesarean section scar.

The patient, a married woman of 17, was delivered of her first child by lower segment caesarean section on November 29, 1949, following a trial of labour. The child's head was abnormally large, and, although a mild degree of hydrocephalus was considered to be a possible cause, this diagnosis could not be established until after birth. The birth weight was 9 lb. 5 oz. (4.2 kg.). The mother's pelvis was clinically and radiologically normal. To avoid undue lateral extension of the transverse incision in the lower uterine segment during the delivery of the head a short vertical incision was made into the upper segment in the midline, making the incision T-shaped. This wound was closed in the manner described by Mr. D. G. Wilson Clyne (February 19, 1949, p. 323). There was moderate pyrexia during the first four days of the puerperium, which responded to treatment with sulphathiazole and penicillin. Thereafter the mother's progress was satisfactory and she was discharged on December 18. The child died on February 16, 1950.

PHARMACEUTICAL SPECIALITIES (MAY & BAKER) LTD DAGENHAM

'MEPILIN'

For menopausal disorders,
pre-menstrual tension and dysmenorrhœa

THE ASSOCIATION of methyl-testosterone with ethinyl œstradiol as in Mepilin permits a marked reduction to be made in the effective dosage of œstrogen for the control of menopausal symptoms.

Advantages of Mepilin are :—

1. Production of an increased sense of well-being
2. Avoidance of undesirable side effects such as breast turgidity and pelvic congestion
3. Reduced risk of inducing uterine hæmorrhage or withdrawal bleeding

Mepilin contains ethinyl œstradiol 0.01 mg., and methyl-testosterone 3 mg. Bottles of 25 and 100 tablets. Dosage—Menopause: 2 to 6 tablets daily. Pre-menstrual tension and dysmenorrhœa: 2 tablets daily from 10th to 22nd day of menstrual cycle.

Literature and specimen packings are available on request to

1952 SUPPLEMENT TO THE BRITISH PHARMACEUTICAL CODEX 1949

The supplement, which has the same status as the Codex, has been prepared with the assistance of nine committees representing all branches of medical and pharmaceutical knowledge and brings the main volume up to date in the wide field of pharmacy and medicine. It includes thirty-six new monographs, twenty-two of which are for substances not previously described in the British Pharmacopoeia, its Addendum, or the British Pharmaceutical Codex. There are many new and revised formulae and several important changes in specifications and standards.

Pp. 160.

Price 25s. (postage 6d.)

Remittance with order is requested

THE PHARMACEUTICAL PRESS
17, Bloomsbury Square, London, W.C.1

The patient became pregnant again at an early date, the expected date of confinement being October 31, 1950. Her pregnancy was uneventful. She was admitted to hospital on November 3. There was no disproportion. Labour began on November 9, following surgical induction. The first stage lasted about five hours. Early in the second stage, by which time the vertex was engaged, a change in the shape of the abdomen was observed. The portion of the uterus below the umbilicus appeared broadened and foetal parts were so readily palpable as to indicate uterine rupture. The patient's condition was good and strong uterine contractions continued. On opening the abdomen the lower segment was found to have ruptured without bleeding having occurred. The edges of the previous wound in the lower segment were separated and the gap bridged by intact membranes. The sac was ruptured and a living male child weighing 6 lb. 15 oz. (3 kg.) was extracted. The tissues of the lower segment were so thin and deficient that there was no safe alternative to subtotal hysterectomy. Both mother and baby made good progress and were discharged on November 26.

W. LOVE.

Scientific Exhibition at the Annual Meeting in Dublin

SIR,—We would like, through the medium of the *British Medical Journal*, to draw attention once more to a new feature which is being introduced at the Joint Annual Meeting of the B.M.A. and I.M.A. in Dublin this July.

This will consist of a series of scientific exhibits, each staged in a stand having an open front of about 10 ft. These exhibits will demonstrate the newest ideas in various branches of medicine and surgery and will be open to all members attending the meeting; a member of the profession will be in attendance at each stand to deal with any queries.

The scheme in this, its first year, will necessarily be small in extent, and those wishing to avail themselves of space should apply as early as possible, so that the organizers may make adequate arrangements. The general pattern will follow, on a much smaller scale, the exhibitions held at the annual meetings of the American Medical Association. Originality in display will be welcomed, and charts, drawings, specimens, and other displays can be provided with lighting, which should increase the value of the display. No charge will be made for stands, nor for reasonable lighting.

Full particulars of the stands and details of method of application will be found on page 100 of the *Supplement*.—We are, etc.,

R. A. Q. O'MEARA. M. D. HICKEY.

POINTS FROM LETTERS

Prostatic Obstruction and Hernia

Mr. J. CLAPHAM COATES (Hull) writes: Mr. Thomas Moore's medical memorandum (February 16, p. 362) rightly advocates the simultaneous treatment of hernia and the causative prostatic obstruction. Another simple method of attaining the same end is to take advantage of the exposure of the prostate to gain access to the internal aspects of the femoral or inguinal canals as originally proposed by Henry. This adds very little to the operation. Henry's method is a very good one for femoral hernia as a routine, but its value in oblique or direct inguinal hernia is more debatable and I use it for these only where there is associated prostatism. I agree with Mr. Moore that, with modern chemotherapy, the disadvantages are mainly theoretical. Elderly patients are always very pleased to part with two disabilities at one operation.

Pink Disease and Infections in Infancy

Dr. W. J. M. McLEOD (Belfast) writes: I read with interest Dr. A. S. Cook's letter (February 16, p. 383) on pink disease. Before the advent of antibiotics I saw an infant with typical pink disease well established for six weeks, when it developed whooping-cough. Treatment consisted of vitamin supplements, especially B complex. The whooping-cough proceeded to a moderate attack without complications. In three weeks' time there was neither sign nor symptom of pink disease. In a brief

search of the literature at the time I could not find any similar occurrence reported, but did find a statement that in Australia pink disease had been cured by an attack of measles. There would appear to be scope for investigation of the relationship between pink disease and the common infections of infancy by someone able to cast a wide net.

Forgotten Tourniquet

Dr. C. D. SANDERS (Kuala Lumpur) writes: It is nowadays understood that not only shall the person putting on a tourniquet be responsible for timing and also removal of it, but the anaesthetist, as it is put on under his supervision in the anaesthetic room in the majority of cases, shall also share the responsibility, leaving the surgeon, freed of clock-watching, to press on with his task. Various devices, such as egg-timers, stop-watches, and tying the anaesthetist's wrist or gown to the end of the tourniquet tape, have been used, but none are altogether satisfactory. The most satisfactory device I have so far come across is a timer which can be set for any number of minutes up to one hour, and when the allotted time has expired a bell rings. It is attached quite simply to the anaesthetic machine. The obvious advantage of such a timer is that the automatic ringing of the bell informs everyone in the theatre that the allotted tourniquet time has expired.

Medico-Legal

DAMAGES FOR PERSONAL INJURIES

[FROM OUR MEDICO-LEGAL CORRESPONDENT]

In civil actions arising out of personal injury or death the task of compensating the victim in terms of money falls upon the jury if there is one. If there is not it falls upon the judge. Either party can appeal to the Court of Appeal if dissatisfied with the amount awarded, but the Court of Appeal will interfere only if the court below either took into consideration or omitted from consideration something which in law it should not have done, or arrived at a figure which in the view of the Court of Appeal was wholly unreasonable. There is a further appeal by leave only to the House of Lords. Whether such an action is tried at first instance by a judge and jury, or a judge alone, depends on whether either party asks for a jury.

The difficulties involved in assessing a proper amount have been commented on in the Court of Appeal¹ in an action in respect of personal injuries to a boy of 6 who was knocked down by a motor-cycle. As a result of injury to his head his whole personality had been changed, and from a bright intelligent boy he had become irritable and irresponsible in his actions. The court of first instance, sitting without a jury, awarded him £5,000 damages, and the appeal was brought on the ground that the award was inadequate.

The Lords Justices in dismissing the appeal said that in cases of serious personal injuries it was most desirable that damages should be assessed by a jury. To make such an assessment was one of the most difficult tasks which fell to a judge sitting alone. In the past, most such cases had been tried by juries, and then there was a period when insurance companies thought a judge would not be as sympathetic as a jury and juries went out of fashion. Later, insurance companies concluded that a judge was apt to give more damages than a jury, and they became more attached to juries.

Lord Justice Singleton added that in his view the time of the courts would be saved if in cases of serious personal injury damages were assessed by a tribunal composed of three judges of the King's Bench Division. He thought they would reach a decision on a more stable basis than had been reached so far in the assessment of damages, and he thought their decision should be final.

This suggestion should be of particular interest to the medical profession and to the Ministry of Health, because serious personal injuries or death are involved, as the readers of these columns will be well aware, in nearly all actions for professional negligence against doctors and hospital authorities.

¹ *Manchester Guardian*, July 4, 1951.

Obituary

Sir CHARLES SHERRINGTON, O.M., G.B.E., M.D.
F.R.C.P., F.R.C.S., F.R.S.

The death on March 4 of Sir Charles Sherrington at the age of 94 is the passing of the man of genius who laid the foundations of our knowledge of the functioning of the brain and spinal cord. His classic *Integrative Action of the Nervous System* (1906) is still a source of inspiration to physiologists all over the world; it was reprinted as recently as 1947 for the first post-war International Congress of Physiology. His work did for neurology what the atomic theory did for chemistry. Neurones were shown to be the functional units of the nervous system, and their orderly interaction on one another through synapses—a term he invented—formed the basis for understanding of reflex action and of many common clinical conditions, such as tabes dorsalis and hemiplegia. He received many honours, including the Order of Merit in 1924, and in 1932 the Nobel prize in physiology and medicine jointly with Dr. E. D. Adrian.

Charles Scott Sherrington was born in London on November 27, 1857, and educated first at Ipswich Grammar School. He then began his medical studies at Edinburgh, but was soon transferred to Cambridge to be with his brother, and he entered Caius College, where he was later to be a Fellow and then an Honorary Fellow, in 1880 when he was nearly 23. At this time the notable part of the Cambridge Medical School was the physiological department, which had been built up by Sir Michael Foster and which contained such men as W. H. Gaskell and J. N. Langley, both working on the physiology of the nervous system. In fact Sherrington published his first scientific paper with Langley in 1884, the year in which he went down to begin his clinical studies at St. Thomas's Hospital, and the subject was a histological study of the brain of a dog on which F. L. Goltz, of Strasbourg, had previously demonstrated the physiological effects of decortication. Before he qualified M.R.C.S. in 1885 he had also found time to go to Alsace for a brief while to work with Goltz.

At this formative period he was not yet committed to neurology. In the summer of 1885 he was sent by the Royal Society, with C. S. Roy and J. J. Graham Brown, to study a cholera epidemic in Spain, and in the following year for a similar purpose to Italy, afterwards going on with his necropsy material first for two months to Virchow's laboratory in Berlin and then

transferring to that of Robert Koch, where he stayed nearly the whole of 1887. During this time he attended courses on bacteriology and histology, including one by Waldeyer, who in 1891 was to establish that the nervous system was composed anatomically of discrete microscopic units, the neurones. He also worked for a month with the experimental physiologist Zuntz. When he returned to London towards the end of the year he was appointed lecturer in physiology at St. Thomas's Hospital.

Anatomy, pathology, and physiology were not then so completely separated in thought and practice as they are to-day. Sherrington's only paper in 1888 was on the pathological anatomy of a case of locomotor ataxy.

The following year he published among other work some observations on the formation of scar tissue and the processes of healing, and in 1891 his publications included two in the *British Medical Journal*, "Note on Some Functions of the Cervical Sympathetic in the Monkey," and "Note on the Nerve Supply of the Bladder and Anus." At the same time he was interested in leucocytes, and in measuring the blood volume, but his principal effort remained in neuro-anatomy and neuropathology, and for this his foreign experience was very valuable. Even the cholera investigations were not wasted, since through them he had met the Spanish neuro-anatomist Ramón y Cajal, and the Italian Golgi.

In 1891 he was appointed professor and superintendent of the Brown Institution in succession to Victor Horsley. This was a veterinary hos-

pital (destroyed during the 1939-45 war) intended for the prevention of cruelty to animals, and Sherrington was able to experiment on the animals under the terminal anaesthesia which was humanely and mercifully destroying them. Now at the age of 34 he began his classical researches by making a systematic study of the effects of cutting the dorsal and ventral spinal nerve roots in cats, dogs, and monkeys, discovering their segmental distribution and mapping the sensory dermatomes, which are similar in monkey and man. He found also that one-third to one-half of the nerve-fibres passing to a skeletal muscle are sensory nerves, and not all motor nerves as hitherto assumed, and that they were linked to the muscle spindles previously described by Golgi. This was the discovery of a new sense, proprioception, and led to the understanding of tendon reflexes such as the knee-jerk, and the classification of the pathological physiology of such diseases as tabes dorsalis, where the spinal tracts carrying the proprioceptor impulses are damaged. It led on, also, to

[Allan Chappelow, B.A.]

the study of the reciprocal innervation of antagonistic muscles and their reflex interactions—work now a commonplace of elementary teaching in every medical school. A second line of work was the precise mapping of the motor area of the cerebral cortex in monkeys, with the effects of stimulation and ablation of different parts of it, which led to the understanding of decerebrate rigidity as the free play of lower brain centres released from cerebral control, and hence to the explanation of the signs of hemiplegia.

This work was continued and developed when Sherrington moved to the Holt chair of physiology at Liverpool in 1895. Much of it was brought together and interpreted in the *Integrative Action of the Nervous System* (1906), henceforth a classic. In 1913 he left Liverpool for the Waynflete Chair at Oxford, and took up the more detailed analysis of individual reflexes, in particular the stretch reflex by which the tone of an individual skeletal muscle is maintained in response to stimuli from the stretch sense organs in its own substance. This and much other work was summarized in *Reflex Activity of the Spinal Cord* (1932), written jointly with his collaborators, J. C. Eccles, E. G. T. Liddell, D. Denny-Brown, and R. S. Creed. He retired from the chair in 1936, at the age of 79.

In addition to his neurophysiological researches Sherrington made special investigations for various bodies, including the B.M.A. (effects of chloroform, 1902–6) and a number of Government Departments, and found time to take an interest in school hygiene, and to sit on many official committees (sight tests, 1910–12, factory lighting, 1913, etc.), and to act as chairman of the Industrial Fatigue Board (1918) and of the committee on Foot and Mouth Disease (1924). He also served a term on the Medical Research Council. Very many honours and distinctions came his way. He held honorary doctorates of 21 universities throughout the world, and was an honorary fellow, member, or associate of over 40 academies. He was a president of the Royal Society and a Royal and Copley medallist, an honorary F.R.C.P. (1912) and F.R.C.S.Eng. (1921), and a president of the British Association (1922, the year in which he was created G.B.E.). He became a member of the British Medical Association soon after qualification, and served as secretary of the physiology section (London, 1895), vice-president (Ipswich, 1900; Toronto, 1906), and president of the anatomy and physiology section (Belfast, 1909). He was quite a frequent contributor to the *British Medical Journal*, a special issue of which (November 22, 1947) was produced to celebrate his 90th birthday, and his last contribution was an appreciation of Goethe (1949, 2, 449).

The Integrative Action of the Nervous System provided above all a set of concepts by which the nervous system could be understood. In his Gifford lectures, published as *Man on His Nature* (1940; second edition with bibliography of all his writings, 1947), Sherrington expanded his philosophical outlook to consider the place of mind in the universe. This discussion was partly historical, and part of it was further elaborated and considered in *The Endeavour of Jean Fernel* (1946). The elaborate care with which these books were written illustrates his interest in words, which found another expression in the writing of poetry, some of which was published in 1925 in *The Assaying of Brabantius*. The reading of Spanish literature was a by-product of his expedition of 1885, and he had a wide acquaintance with many literary by-paths, and with painting and architecture. As an undergraduate he had played for

his College XV, and been a mountaineer, in spite of short sight. He married in 1892. His wife died in 1933, and they are survived by one son.

We are much indebted for the following appreciation to Dr. E. D. Adrian, O.M., P.R.S.: Sir Charles Sherrington retired from active work in the laboratory 17 years ago. Since then his Gifford lectures, *Man on his Nature*, and his book on Fernel have had wide recognition from a public knowing little of the nervous system, and he has been thought of more and more as our foremost authority on the development of biological ideas, on man's interpretation of his experiences. So he was; but he is the scientist's philosopher because he had advanced natural knowledge himself by skilled observation and experiment, by 50 years' unremitting work in the laboratory, and because his own interpretation of his discoveries had given a new extension to the biologist's outlook. Physiologists will know this well enough. To those who have had to struggle with the mass of detailed material about the brain and cord Sherrington's *Integrative Action of the Nervous System* brings order out of chaos: it is hard reading at first, because every sentence is charged with meaning, some of it direct enough, but some reaching out to half-formed pictures of a wider landscape. Though it was published in 1906 it is still as refreshing as it was then. It has needed no revision, but Sherrington's experimental work went on at high pressure for another 30 years, filling in the gaps and strengthening the framework.

He had a mastery of all the technique of mammalian experiment, so that no laboratory in the world could vie with the standard he set at Liverpool and Oxford, and he was an acute observer who could see all that was happening outside the immediate range of his experiments. But it is very seldom that such a brilliant experimental skill is combined with such an appreciation of wider bearings. He studied the spinal reflexes, and through them he came to the picture of man reflecting on his nature.

It was always a great privilege to listen to his talk, for he had a store of vivid reminiscences about the events of his long scientific career, about his mission to Spain in 1885 to study the cholera epidemic, his dinner with Pavlov in Leningrad in the troubled times of the Tsarist regime, his work at the Brown Institute, and all the notable people he had met. And his stories of these remote times, seldom repeated and never without some fresh detail, were the stories of a man who was a scientifically trained observer of persons and things but was never without a kindly tolerance and wisdom. He faced life with a deep humility and no malice: he could be indignant at insincerity and pretentiousness and at the abuse of authority, and he was an effective councillor and administrator because his modesty did not prevent him from speaking his mind. But his poetry and the books and lectures he published after his retirement show most clearly why he was so well loved. Even in his strictly scientific writings he could not conceal his charming flashes of humour, his lively imagery, and his wide range of knowledge, but it is in some of his shorter poems and in his occasional lectures that Sherrington is revealed most clearly.

The lecture on Goethe which he gave at Lady Margaret Hall in 1942 is a good example. He took great pains to be fair to Goethe as a scientist and published an expanded version of the lecture seven years later. The opening sentences could not have been written by anyone else. They show not only Sherrington's tricks of language and construction but how tellingly he could use them. "Two facts we may, at outset, recall about Goethe. Poet though he was, he was yet lifelong an ardent student of the sciences of Nature. And this other, that with him—not merely as usage of the German language—Nature was usually Nature with a capital N. The thoughts of few men can be more liberally on record than are Goethe's, biographically and autobiographically, in his formal views and in his correspondence. We may look therefore to exceptional opportunity of knowing what this Nature with a capital N stood for in his mind. He would have wished us to know."

Sherrington the scientist, in spite of all his courtesy and tolerance, cannot quite bring himself to stomach Goethe's setting himself up as a greater Newton, but Sherrington the poet could not resist the pleasure of quoting Goethe's verse or withhold admiration for his courageous acceptance of the world. Sherrington's acceptance of the world was that of a man of essential humility, realizing all the limitations of the human intellect but finding a constant encouragement as his researches brought him closer to what is at least one aspect of the truth. He was puzzled by the problem of mind and matter, a real problem to him and not a verbal quibble, but he had found an absorbing interest in both sides of the picture and he was grateful that his friends took such a kindly view, so he would have described it, of what he had done.

Dr. F. M. R. Walshe, F.R.S., writes: To his physiological colleagues and pupils we may leave the just description of Sherrington's contribution to their science, the appreciation of what these have meant to physiology, and also—and perhaps even nearer the heart—the expression of their deep sense of the lustre he has conferred upon the British school of physiology.

There remains to be given to his memory a tribute of affection and admiration not less sincere or gladly given from the body of clinical neurologists. It would be difficult to overestimate the inspiration he has been to clinical neurology, or the influence his work and genius have had upon neurological thought throughout the world, but perhaps first and most deeply in his own country.

There is perhaps something singularly appropriate in this, for it was from a clinical neurologist, Hughlings Jackson, that Sherrington himself derived no little inspiration. The very phrase, "Integration keeps pace with differentiation," that we associate with Sherrington, and that we find implied in the title of his classic work, *The Integrative Action of the Nervous System*, he took from Jackson, and he has returned to neurological medicine in overflowing measure the gift he got from its most distinguished exponent.

Those who are familiar with neurological literature during the early years of the present century will find that neurology had in that period departed somewhat from the close and fruitful association with experimental neurophysiology that it had enjoyed during the last quarter of the nineteenth century. Largely under Continental influences, it had become predominantly nosographical in methods and interests, and the steady growth of new knowledge and the discovery of new diagnostic signs were not being accompanied by a corresponding analysis and interpretation of these phenomena in physiological terms. For example, the florid and purely descriptive terminology that grew up around the study of cerebellar syndromes—based upon no scientific principles, telling us nothing of cerebellar functions, but showing wholly undeserved powers of survival in the literature—illustrates the contemporary outlook of the period, and another example of this was the crop of eponymous signs and syndromes that developed like unsightly weeds in neurological writings. Then, during the second decade of the century, the influence of Sherrington's work began to show itself in clinical neurology in this country, a little later in America, and still later and haltingly and imperfectly on the Continent. Physical signs hitherto regarded purely empirically began to find interpretation in terms of physiology. The familiar Babinski plantar response was found to be an integral part of Sherrington's nociceptive flexion reflex, the hypertonus of upper motor neurone lesions was qualitatively identified with decerebrate rigidity. Later the work of Magnus and de Kleijn, an offshoot of Sherrington's school, provided the elucidation of other clinically observed phenomena. This process of rationalizing symptomatology has gone on steadily and is not yet ended, and the face of clinical neurology has changed remarkably in our time under the living influence of Sherrington's work. Nor is this all, for the carrying over of animal physiology to man makes its own contribution to physiology.

But it is not for this alone that neurologists will remember Sherrington, it is not only as one of the master builders of modern neurology that he has gained our regard. All those who have had the privilege of knowing and working with him, or have sought his assistance in their problems, will recall his sympathetic interest and his unstinted generosity in time and effort, and not less the thousand and one kindnesses he so unobtrusively and thoughtfully rendered them. Great as was his scientific achievement, he was far greater than his work, and it has been given to few men to command the intense warmth of affection and regard that Sherrington aroused in all who had the privilege of his friendship.

In his writings, whether purely physiological or philosophical as in his Gifford lectures, Sherrington's literary style was all his own, and, difficult as it sometimes was, it nevertheless came to have a fascination for those who knew it and appreciated its essential clarity. Some of his verbal coinings have permanence and have taken their place in nomenclature, and of these the term "synapse" is perhaps the most familiar example.

As we survey in retrospect the vast mass of his writings, perhaps one small disappointment remains—namely, that in his Gifford lectures he came to rest upon so negative a position in respect of the problem of the relationship of mind to the nervous system. Some cannot believe that this is the last word on the subject, even the final word that could be uttered in the present state of knowledge. Yet his conclusion will satisfy many as being more prudent than the false simplicities of those who say that the problem is a phantom one and evade its difficulties by saying that it does not exist. The problem is not yet solved, nor within sight of solution, and it is surely better that he should have said so than that he should have had recourse to an easy dialectic that is no substitute for knowledge.

If we have to sum up the lesson of his work for science, surely it is that he combined in it a perfect balance of accurate observation and the capacity to ask the right questions of Nature with an imaginative and logical synthesis of the facts that in sum constitute the true quality of scientific genius.

Professor J. C. Eccles, F.R.S., writes: The impact of the news of Sherrington's death left his friends a tragic sense of personal loss. There was a sudden realization that one could no longer communicate with that mind of unsurpassing versatility and vigour. I recently returned to England after nearly 15 years' absence and expected that Sherrington would be changed beyond all recognition, on account of his physical disabilities. One approached him with some misgiving and apprehension. But immediate reassurance came on hearing him speak. Here was the same person that we had known and loved still speaking from that aged and disabled body. There was even at times that bird-like quizzical look, that sharp understanding, and there was as always that solicitude for friends.

We should try to see his life in the long perspective of years as the unity that it was to him. For nearly 50 years there was that amazing performance as a scientific investigator. We can now only faintly realize the labour and insight that were required in order that the prevailing vagueness and confusion should be reduced to those clear principles on which modern neurology is so securely based. One thinks at random of synapse, convergence, and the final common path, the motor unit, algebraic summation of the excitatory and inhibitory influences on the motoneurone.

But throughout all this detailed analytical study he never lost sight of the behaviour of the whole animal and that ultimate of all human problems: What is the nature of man? It can be said that in the last two decades of his life he was obsessed with this problem, for he returned to it again and again. He knew that many of his friends and colleagues had not accepted his dualistic view of man. Only nine days before his death he spoke to me at length, and I can recall some pertinent fragments. "My writings on dualism have not been well received; they have found a

...ANOTHER UNUSUAL USE FOR 'Sleek'

plastic zinc oxide adhesive strapping

One of the few ancient crafts still practised all over England is basket weaving—work that is unusually hard on the fingers. Gloves are a hindrance, so many a craftsman binds a strip of 'Sleek' across vulnerable fingers—just what is needed to keep the hands free from scratches.

to emphasize

Yes, 'Sleek' does get put to some intriguing uses. These unusual jobs lend dramatic emphasis to the unique qualities which make 'Sleek' of **outstanding value for everyday use in hospital and surgery practice**. Above all, because the plastic base material is impervious to liquids, it is waterproof. 'Sleek' is washable, yet does not soil easily. It is smooth and thin yet very strong. It is extensible and pliable. It does not 'catch' or fray.

8 valuable qualities

WATERPROOF · GREASEPROOF · WASHABLE · SMOOTH
THIN · STRONG · PLIABLE · NON-FRAYING

'Sleek'

plastic zinc oxide adhesive strapping

In 2½ yd. rolls, 1" wide. In 5 yd. rolls, 1", 2", 3" and 4" wide. FREE SAMPLE sent on request.

Also

'HANDYPLAST' elastic wound dressing. With an AIR-STRIP to promote quicker healing. Strips, 1½" and 2½" wide and packs of assorted dressings.

'LEUKOPLAST' zinc oxide adhesive plaster. Laboratory controlled to ensure constant and uniform quality of the cotton cloth and adhesive strength. In 5 yd. and 10 yd. rolls—½", 1", 2" and 3" wide.

HERTS PHARMACEUTICALS LTD., WELWYN GARDEN CITY, ENGLAND

What is all this
about spray-drying?

This modern low temperature process of drying milk foods preserves the colloidal condition of the protein on reconstitution and ensures that the fat is in the form of a finely diffused emulsion. Humanised Trufood is spray-dried. When Trufood is reconstituted, the resultant fluid, with the fat in the form of cream, has all the physical characteristics of true milk. This is one of the factors distinguishing Trufood from ordinary milk foods—another reason why Trufood is the most satisfactory alternative to breast milk.

BEREX

Reg. Trade Mark

SUCCINATE - SALICYLATE THERAPY

Licensed under DOLCIN Patent. Patented in Great Britain 642971

IN TABLET FORM

For the relief of symptoms
and aid in the control of the systemic
metabolic disturbances found to be
associated with Arthritis and
all Rheumatic disorders

INDICATIONS

1. Rheumatic Fever.
2. Articular Rheumatism (including Rheumatoid and Osteo-Arthritis).
3. Non-articular Rheumatism (including Fibrositis, Neuritis and Sciatica).
4. Arthritis associated with the menopause.
5. Gout.

FUNCTION

A stimulating effect on cellular respiration and respiratory enzyme systems, together with an increase of oxygen utilisation by the tissues (impairment in tissue oxygenation having been demonstrated in arthritis).

Since Berex is non-toxic it may be prescribed whenever massive salicylate therapy is indicated.

BEREX combines the following advantages:
Prompt relief of symptoms ; correction of impaired
tissue oxidation ; obviation of salicylate toxicity ;
suitability for protracted administration.

Professional sample and literature on request to :

very unfavourable climate of opinion." "X thinks Nature is very simple, but it is not like that." "For me the ultimate reality is the soul of man."

I would venture to suggest that had he lived longer he would soon have seen the climate of opinion growing more favourable, a change that would be largely due to his own pertinent arguments for the reality of both the body and the mind of man.

Medical Notes in Parliament

LORDS' AMENDMENTS TO DENTISTS' BILL

The House of Lords on March 4 went into Committee on the Dentists' Bill.

Lord WOOLTON moved to insert a provision that the General Dental Council could direct that a person who had passed examinations required to obtain a foreign diploma should be treated as a person holding a foreign diploma. He said this was designed to prevent hardship to about 30 foreign dentists in the United Kingdom who, although they had passed their examinations in the country where they were trained, had been deprived of their diplomas for political or religious reasons. Lord JOWITT suggested that refugee Jewish dentists who had fled to Britain from the Hitler tyranny and had not practised dentistry for a considerable time might require some kind of refresher course. He presumed there was power for the General Dental Council to impose such a course. Lord WOOLTON agreed to look into the matter, and the House approved the amendment.

Lord SILKIN moved to insert a provision instructing the General Dental Council, within 12 months after the coming into force of the clause, to make regulations for the establishment of dental prosthetists. These were defined as dental technicians with special qualifications to undertake the fitting, insertion, and fixing in the mouth of dentures, artificial teeth, and other oral dental appliances. He said the prosthetist would be permitted, with proper supervision, to take the impression in the mouth, to fit the denture, and to complete the job. The framers of the Bill had left it to the General Dental Council to decide whether or not regulations should be made in any particular category of dental auxiliaries. He proposed that it should be obligatory upon the Council to make regulations setting up this class. He realized that the amendment would not be welcomed by the dental profession, who had made public a number of objections to it. It was expected that some 2,000 technicians would undergo the necessary training to permit them to become registered as dental prosthetists.

Lord WEBB-JOHNSON urged the Government not to accept the amendment. To allow technicians to do work which should be done by qualified dentists was not justifiable. When there were dangers in carrying out a procedure that procedure should be in the hands of a qualified professional man. Badly fitting dentures might lead to loss of other teeth and to serious disease of the gums. He had seen several cases of cancer produced on the gum by badly fitting dentures. The right body to decide whether a special ancillary class should do this work was the General Dental Council.

Lord WOOLTON could not accept the amendment. He had discussed the matter with Mr. Crookshank and had no reason to think that the Minister was likely to alter his mind.

The amendment was withdrawn. The House accepted another amendment, proposed by Lord ONSLOW, to make it clear that ancillary dental workers, while permitted to work as such only in specified services, might, if qualified to do another kind of ancillary work (for example, that of an oral hygienist), be permitted to work in that wider field. On the motion of Lord WEBB-JOHNSON the House accepted an amendment providing that dental auxiliaries should be permitted to extract only deciduous teeth.

Dental Companies

A long amendment dealing with the right of appeal of dental companies to the Privy Council against the decision of the General Dental Council to end their right to continue in the business of dentistry was proposed by Lord WOOLTON and accepted. He said the Government considered that the growth of such companies was rather undesirable. Since the National Health Service started 37 new dental companies had come into existence, and the total was now 62. The majority were small companies, employing one or two operating staff.

Lord WOOLTON promised to look into the nomenclature of dentists and ancillary workers before the report stage. Lord WEBB-JOHNSON reminded him that anyone who attempted to persuade the public that he was a qualified medical man when he was not was subject to penalties. For the protection of the public the titles of dentist, dental surgeon, and dental practitioner should be equally protected. Lord WOOLTON said protection was already given by the Act of 1921.

Tuberculosis in Tyneside

Mr. EDWARD SHORT on March 7 said that in 1919 the incidence of tuberculosis of the lung was much the same on Tyneside as in the rest of England, but that in the following 20 years the rate for England and Wales was halved while the rate for Tyneside dropped only slightly. From 1939 to 1949 the rate for Newcastle-upon-Tyne and most of the Tyne area became almost double the national level. Since the war there had been a great improvement, but the relative position between Tyneside and the rest had not improved at all. It nearly reached the high level of incidence in Scotland, which had been mentioned by Mr. Walter Elliot in an article in the *British Medical Journal* (1949, 2, 297). Mr. Short mentioned that the position for lung cancer was now nearly as bad as for pulmonary tuberculosis. Various reasons could be adduced for this. There was a very large child population and the schools were overcrowded. There was a large Irish population. The new tendency in the North-east for married women to remain at work might have increased the figures. But the greatest single factor in the Newcastle area was poor housing. By the standard of the Housing Act, 1936, more than 20% of the population of the city were overcrowded. Night sanatoria might help—they had been tried successfully in London—and there was also a question of hostels for children living in infected households.

Miss PAT HORNSBY-SMITH said the number of deaths from tuberculosis on Tyneside was half that of 20 years ago, despite a rapid increase in population. Deaths from respiratory tuberculosis in Newcastle-upon-Tyne were 227 in 1945 and 183 in 1950, a reduction of one-fifth. In Northumberland the figures were 186 in 1945 and 124 in 1950, a reduction of one-third. The figure for the whole of England and Wales over the same period showed a reduction of one-third. The figures for 1951 were not wholly available, but there was in general a substantial reduction in tuberculosis mortality. Tyneside figures were higher than those for some other areas, but were being progressively reduced. Figures for notification did not fall so fast, because increased numbers had been detected by mass-radiography.

Doctors' Cars.—Mr. Peter Thorneycroft informed Dr. Stross on March 6 that he was still considering representations made by the British Medical Association that some doctors could not find the money to pay a deposit of one-third for purchase of a motor-car and the remainder in 18 months.

Dr. Kroll.—Mr. Crookshank assured Mr. H. Hynd on February 28 that all suitable treatment for patients with certain brain injuries was already available within the National Health Service, and there was therefore no need for them to be sent to Dr. Kroll in Germany.

Vital Statistics

Smallpox in Lancashire

The diagnosis of variola minor is certain, and there have been no deaths. There was a flurry of cases at the beginning of March, but in the past few days the incidence has fallen. The disease is confined to Rochdale, apart from a few patients resident in neighbouring districts who were infected in Rochdale. In Littleborough U.D. the first case to be recognized was in an unvaccinated child who had been in contact with a patient in Rochdale but was not under surveillance. He sickened on March 1, developed a rash on March 5, and was removed to hospital on March 7. There are no reports of the disease in any other part of the country.

Notifications of smallpox received by the general register office this year are as follows: in the week ending February 16, 1; February 23, 18; March 1, 7; and March 8, 62.

Graphs of Infectious Diseases

The graphs below show the uncorrected numbers of cases of certain diseases notified weekly in England and Wales. Highest and lowest figures reported during the nine years 1943-51 are shown thus $\cdots$, the figures for 1952 thus — . Except for the curves showing notifications in 1952, the graphs were prepared at the Department of Medical Statistics and Epidemiology, London School of Hygiene and Tropical Medicine.

Infectious Diseases

During the week ending February 23 an increase was recorded in England and Wales in the number of notifications of measles 754, scarlet fever 132, and whooping-cough 98, while the largest decline was 45 for dysentery.

A small increase in the incidence of measles was recorded in most parts of the country. The largest rises were Lancashire 191 and Durham 173. The variations in the local trends of scarlet fever were small; the only exception was a rise of 41 in Lancashire. The rise in the incidence of whooping-cough was due to the experience of the southern section of the country, while in the north a small fall was reported. The notifications of diphtheria were 11 fewer than in the preceding week; the chief feature of the returns was a decline of 8 in Lancashire. Almost one-half of the diphtheria cases in the country were notified in three towns—Lancashire, Darwen M.B. 6; Warwickshire, Birmingham C.B. 5; and Devonshire, Plymouth C.B. 4.

The 18 cases of smallpox were notified from Lancashire, Rochdale C.B.

The notifications of acute poliomyelitis were 4 fewer for paralytic cases and 2 fewer for non-paralytic cases than in the preceding week. Liverpool C.B. with 2 cases was the only administrative area with more than one case.

The largest centres of dysentery were Lancashire 129 (Liverpool C.B. 37, Oldham C.B. 30, Manchester C.B. 25); Norfolk 65 (Norwich C.B. 62); London 56 (Hackney 11, Islington 10); Surrey 42 (Woking U.D. 11); Middlesex 42 (Willesden M.B. 17); Glamorganshire 33 (Cardiff C.B. 28); Southampton County 20 (Portsmouth C.B. 10); Northumberland 20 (Newburn U.D. 13); Yorkshire West Riding 20.

Week Ending March 1

The notifications of infectious diseases in England and Wales during the week included: scarlet fever 1,506, whooping-cough 2,789, diphtheria 33, measles 6,233, acute pneumonia 1,061, acute poliomyelitis 19, dysentery 647, paratyphoid fever 12, and typhoid fever 4.

INFECTIOUS DISEASES AND VITAL STATISTICS

Summary for British Isles for week ending February 23 (No. 8) and corresponding week 1951.

Figures of cases are for the countries shown and London administrative county. Figures of deaths and births are for the 160 great towns in England and Wales (London included), London administrative county, the 17 principal towns in Scotland, the 10 principal towns in Northern Ireland, and the 14 principal towns in Eire.

A blank space denotes disease not notifiable or no return available. The table is based on information supplied by the Registrars-General of England and Wales, Scotland, N. Ireland, and Eire, the Ministry of Health and Local Government of N. Ireland, and the Department of Health of Eire.

Medical News

Medical Society of London.—Mr. A. C. Palmer presided over the 172nd anniversary dinner of the Medical Society of London at Claridge's on March 6. After the loyal toasts and the customary silent toast to John Coakley Lettsom the health of the society was proposed by Lord Radcliffe. Expressing his pleasure to be dining with the society, he said that in reading the life of Lettsom he had been interested to see the emphasis Lettsom placed upon the pleasures of dining—"tea, punch, and fine liqueurs came in their turn." Lord Radcliffe said he enjoyed speaking to members of a kindred profession, for this made for informality. But the learned professions were a dying industry. The ideals of a factory civilization were creeping in, clocking-in and clocking-out being the rule of the day. People might come to forget what was the meaning of these learned professions, requiring a long apprenticeship in their skill and a background of knowledge studied as a fruitful source for the pursuits of the calling. The learned professions were institutions with a long history behind them. Their traditions and codes built up over the years gave them, the members of the profession, strength. With the help of its codes and standards a member of a learned profession had the guidance necessary to balance, as he always had to, the interests of the patient or client and the interests of society. These were virtues which you could destroy but not re-create. Lord Radcliffe ended by giving an enchanting description of Zoffany's picture of Lettsom, the founder of the society. Zoffany, added Lord Radcliffe, was the perfect painter of the conversation piece.

In reply the president said he could recall no time in which there had been such a flowering of new discoveries in medicine, and it was the function of the society to discuss these. Somewhere beyond the future, he said, there lay perhaps the discovery of the ingredients of synthetic man. He ended by paying a tribute to the honorary secretaries and the treasurer of the society and to Sir Hugh Lett, who, he said, had taught him the principles of surgery. The health of the visitors was proposed in a witty and apt speech by Dr. Wilfrid Oakley, who, admitting that in a moment of weakness he had agreed to propose the toast, said he now understood the fate of the Roman Empire, which at least had had the wisdom to decline before it fell. In welcoming the principal guest of the evening, Lord Radcliffe, he made appreciative reference to his recent Reith lectures on "Power and the State." He reminded those present of one of Sir Hugh Lett's early contributions to surgery, which was a statistical review of a thousand cases of appendicitis, and also of Sir Hugh's accomplishments as a musician. In reply Sir Hugh Lett said that as a registrar at the London Hospital he was encouraged by Treves to collect records of cases of appendicitis, and that was how he came to give his account of the thousand cases. Treves was led to this as a result of a discussion which took place in the Medico-Chirurgical Society. Sir Hugh, in paying a tribute to the society, said that the standard of its lectures and discussions was very high. They had a fine old library, and pervading everything was a friendly and genial atmosphere of its own. Together with Jonathan Hutchinson, junior, he had presented a paper to the society in 1905. Sir Hugh ended with a warm tribute to the president, Mr. A. C. Palmer, whom he recalled as a New Zealander who played rugger for England against Ireland.

Ministry of Health NOT in Whitehall.—Although the Ministry changed its address over eight months ago, four out of every ten letters are still wrongly addressed. This not only causes delay but involves extra work in sorting and re-directing. All correspondence should be addressed to Savile Row, London, W.1.

New Medical Journal at Leeds.—The University of Leeds used to produce a medical magazine which was partly the

organ of the Medical Society and of students, nurses, and auxiliaries. However, it was found that most of the subscribers were qualified doctors, and the magazine has therefore been reborn as the *University of Leeds Medical Journal*, with the support of the Leeds and West Riding Medico-Chirurgical Society, in a form likely to appeal to the graduate and to general practitioners in the region. There will be three issues a year, the first being a symposium: this year on tuberculosis, and in 1953 on emergencies in general practice. It should play a very valuable part in developing that regional enthusiasm in medicine which is so necessary for healthy development and which the present domination by London may impede.

"Ulisse" Prize for 1952.—*Ulisse*, an international cultural magazine, founded in 1949 a prize of one million lire to be awarded annually to the author of a scientific publication produced during the preceding five years. The 1952 prize will be for a work on biochemistry considered in relation to the human organism, with special emphasis on its application to medicine. Works published during the last five years in Europe (in any European language) will be considered, and entries should be submitted to the *Rivista Ulisse*, Corso d'Italia, 43, Rome, not later than April 15.

Ulster Paediatric Society.—A joint meeting of the society with the British Medical Association (Northern Ireland Branch) was held in the Whitla Medical Institute, Belfast, on February 7, when Mr. James Crooks spoke on sinusitis in childhood, and illustrated his talk with a film showing the out-patient treatment. At a further meeting at the Royal Maternity Hospital, Belfast, on February 19, Dr. Mary Cross spoke on retrolental fibroplasia.

Emergency Bed Service: Applications and Admissions.—During the seven days ending March 10 the number of applications made by doctors to the London Emergency Bed Service for admission of patients was 1,176, of whom 87.15% were admitted.

COMING EVENTS

Cancellation.—The postgraduate course in venereology organized by the Institute of Urology announced in the *Journal* of March 8 (p. 555) has had to be postponed.

Medical Association for the Prevention of War.—The inaugural meeting of the London and Home Counties branch will be held at 8 p.m. on Thursday, March 20, in the Small Meeting Hall, Friends House, Euston Road, N.W.1. Dr. E. H. S. Burhop will speak on atomic physics in the cause of peace. All members of the medical profession are invited. The meeting is in no way under the auspices of the Society of Friends. A short business session will precede the talk to establish a permanent committee. Nominations for members are invited and should be sent to Dr. Antony Ryle, 28, Bartholomew Road, N.W.5.

Postgraduate Radiology Course.—The Faculty of Radiologists is holding a week-end course for postgraduates on March 22 and 23 at the Royal College of Surgeons, Lincoln's Inn Fields, W.C.2. The morning sessions will be devoted to diagnostic radiology and the afternoons to radiotherapy. Details may be had from the dean of the Faculty, 45, Lincoln's Inn Fields, W.C.2.

Week-end Course on Rheumatism.—The Empire Rheumatism Council will hold its spring week-end course for postgraduates at the Arthur Stanley Institute, Middlesex Hospital (Peto Place, N.W.1), on April 25 and 26. The fee for the course will be two guineas, and the number of entries is limited to 60; application should be made to the general secretary, Empire Rheumatism Council, Tavistock House (N.), W.C.1, at least one week before the course.

8th International Surgical Congress.—The International College of Surgeons will hold its next congress in Madrid from May 19 to 24. Full details may be obtained from the secretary of the congress, Instituto Nacional de Medicina y Seguridad del Trabajo, Facultad de Medicina, Pabellón 8, Ciudad Universitaria, Madrid.

Harveian Oration.—The Oration of the Harveian Society of London will be delivered by Sir John McNee at the Royal College of Surgeons of England, Lincoln's Inn Fields, London, W.C., on Thursday, March 20, at 8.15 p.m. His subject is "Infective Hepatitis: A Problem of World Health."

SOCIETIES AND LECTURES

A fee is charged or a ticket is required for attending lectures marked ●. Application should be made first to the institution concerned.

Friday, March 14

SOCIETY OF PUBLIC ANALYSTS: BIOLOGICAL METHODS GROUP.—At Chemical Society, Burlington House, Piccadilly, London, W., 6.30 p.m., "The Assay of Coagulants and Anticoagulants," papers by Dr. Rosemary Biggs, and Mr. V. J. Birkinshaw and Mr. K. L. Smith. A discussion will follow.

Monday, March 17

HUNTERIAN SOCIETY.—At Talbot Restaurant, 64, London Wall, E.C., 7 for 7.30 p.m., dinner-meeting: "The Contribution of Surgery to Neurology," discussion to be opened by Professor Lambert Rogers and Dr. J. Spillane.

Tuesday, March 18

BRITISH POSTGRADUATE MEDICAL FEDERATION.—At London School of Hygiene and Tropical Medicine, Keppel Street, Gower Street, W.C., 5.30 p.m., "Physical Techniques in the Medical Applications of Ionizing Radiations," by Professor W. V. Mayneord.

EUGENICS SOCIETY.—At Royal Society, Burlington House, Piccadilly, London, W., 5.30 p.m., "The Stability of Marriage," by Mr. A. J. Brayshaw, B.A. All interested are invited.

● **INSTITUTE OF DERMATOLOGY, Lisle Street, Leicester Square, London, W.C.**—5.30 p.m., "Parasitic Diseases," by Dr. S. Thomson.

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, London, W.C.—5 p.m., "Transplantation of Homologous Tissue and its Surgical Applications," Hunterian Lecture by Professor M. F. A. Woodruff.

SOUTH-WEST LONDON MEDICAL SOCIETY.—At Bolingbroke Hospital, Wandsworth Common, London, S.W., 8.30 p.m., "Modern Skins and Modern Drugs," by Dr. W. J. O'Donovan.

Wednesday, March 19

BIRMINGHAM MEDICAL INSTITUTE: MIDLAND MEDICAL SOCIETY.—At 154, Great Charles Street, Birmingham, "Diagnosis and Treatment of Ulcerative Colitis," by Professor T. L. Hardy and Mr. B. N. Brooke.

FACULTY OF ANAESTHETISTS: ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, London, W.C.—4 p.m., annual general meeting. 5 p.m., "Antecedents of Early Anaesthetic Apparatus," Joseph Clover Lecture by Professor R. R. Macintosh.

● **INSTITUTE OF DERMATOLOGY, Lisle Street, Leicester Square, London, W.C.**—5.30 p.m., "Immunology in Relation to Dermatology," by Dr. J. O. Oliver.

INSTITUTE OF UROLOGY.—At St. Paul's Hospital, Endell Street, London, W.C., 4.30 for 5 p.m., "Enuresis," by Mr. A. R. C. Higham.

ROYAL INSTITUTE OF PUBLIC HEALTH AND HYGIENE, 28, Portland Place, London, W.—3.30 p.m., "First Aid in the Home," by Dr. R. W. Barr-Brown.

Thursday, March 20

BRITISH INSTITUTE OF RADIOLOGY, 32, Welbeck Street, London, W.—8 p.m., "The Sieve in Radiotherapy," by Dr. B. Jolles.

BRITISH POSTGRADUATE MEDICAL FEDERATION.—At London School of Hygiene and Tropical Medicine, Keppel Street, Gower Street, W.C., 5.30 p.m., "Biological Effects of Radiation," by Dr. J. F. Loutit.

EDINBURGH CLINICAL CLUB.—At B.M.A. Rooms, 7, Drumsheugh Gardens, Edinburgh, 8 p.m., "The Psychological Approach in General Practice," by Dr. A. Murray Marr.

● **INSTITUTE OF CHILD HEALTH, Hospital for Sick Children, Great Ormond Street, London, W.C.**—5 p.m., "Genito-urinary Surgery," by Mr. T. Twistington Higgins.

LIVERPOOL MEDICAL INSTITUTION.—At County Hospital, Whiston, nr. Prescot, Lancs, 2.30 p.m., afternoon clinical demonstration.

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, London, W.C.—5 p.m., "Hyperplasia and Metaplasia in Synovial Membrane," Hunterian Lecture by Professor G. R. Fisk.

ROYAL SANITARY INSTITUTE.—At Town Hall, Tavistock, 10 a.m. Papers: "Rural Planning with Particular Reference to National Parks," by Mr. Geoffrey Clark, L.R.I.B.A., M.T.P.I.; "The Incidence of Infantile Paralysis in a Rural Area During the Last Fifteen Years," by Dr. E. D. Allen Price. Afternoon visits.

ROYAL SOCIETY OF TROPICAL MEDICINE AND HYGIENE.—At Royal Army Medical College, Millbank, London, S.W., 7.30 p.m., laboratory meeting.

Friday, March 21

- BIOCHEMICAL SOCIETY.—At National Institute for Medical Research, Mill Hill, London, N.W., 10.30 a.m., annual general meeting. Scientific papers will be read.
- BRITISH INSTITUTE OF RADIOLOGY, 32, Welbeck Street, London, W.—5 p.m., medical members' meeting; 6.30 p.m., "The Schmidt Camera—Its Possibilities and Limitations in Photo-fluorography," by Mr. W. A. Langmead, M.Sc.
- FACULTY OF RADIOLOGISTS.—At Royal College of Surgeons of England, Lincoln's Inn Fields, London, W.C., 4 p.m., Radio-therapy Section Meeting. "The Application of Plastic Surgery to Radiotherapy," by Mr. J. Scott Tough.
- INSTITUTE OF DERMATOLOGY, Lisle Street, Leicester Square, London, W.C.—5.30 p.m., clinical demonstration by Dr. E. J. Moynahan.
- MANCHESTER UNIVERSITY.—5 p.m., "Women in the Professions," Margaret Ashton Memorial Lecture by Miss Rose Heilbron, Q.C.
- MIDDLESEX COUNTY MEDICAL SOCIETY.—At Hillingdon Hospital, nr. Uxbridge, Middlesex, 3 p.m., general meeting; demonstration of cases, etc.; 4.45 p.m., "Pharyngeal Diverticulum: Aetiology, Diagnosis, and Treatment," paper by Mr. F. Boyes Korkis.
- ST. GEORGE'S HOSPITAL MEDICAL SCHOOL, Hyde Park Corner, London, S.W.—5 p.m., "Nocturia—A Defeat in the Battle Against Gravity," first Thomas Young Lecture, by Professor J. G. G. Borst (Amsterdam).
- SOCIETY OF CHEMICAL INDUSTRY: FINE CHEMICALS GROUP.—At King's College, Strand, London, W.C., 7 p.m., annual general meeting; 7.30 p.m., "The Physico-chemical Aspects of Drug Administration," by Dr. N. Evers.

Saturday, March 22

- NUTRITION SOCIETY.—At Physiology Lecture Theatre, Manchester University, 10.30 a.m., "Diet in Relation to Renal and Cardio-vascular Disease," speakers, Dr. J. F. Wilkinson, M.Sc., Ph.D. (chairman), Professor R. Platt, M.Sc., Dr. D. A. K. Black, Dr. Honor Roscoe, Ph.D., Dr. A. M. Jones, M.Sc., Professor A. M. Boyd, M.Sc., and Dr. A. H. Ratcliffe, D.Sc. A discussion will follow.

APPOINTMENTS

The Queen has appointed Dr. Yeo Kok Cheang to be an Official Member of the Legislative Council of Hong Kong.

- BARCLAY, GORDON ANDREW, M.B., B.Chir., F.R.C.S., Part-time Consultant Surgeon, St. Andrew's Hospital, Devons Road, London, E.
- BIRCHALL, JOHN CRAVEN, M.B., Ch.B., D.P.H., Deputy Medical Officer of Health and Deputy School Medical Officer, County Borough of Croydon.
- BOYLE, GERALD F., M.B., Ch.B., D.P.H., Assistant Medical Officer of Health, County of Strathclyde.
- HAWKSLEY, MRS. MARGARET, M.B., B.S., D.A., Consultant Anaesthetist, Hospital for Sick Children, Great Ormond Street, London, W.C.
- HENDERSON, ALEXANDER, M.B., Ch.B., D.P.H., Medical Officer of Health, County of Kincardine, from October 1.
- SANGSTER, A. J., M.B., Ch.B., D.M.R., Assistant Radiologist, Northern Regional Hospital Board (Scotland).
- SOUTH-WESTERN REGIONAL HOSPITAL BOARD.—Consultant Surgeon to Plymouth Clinical Area, H. D. S. Vellacott, M.B., B.Chir., F.R.C.S. Consultant Physician to Plymouth Clinical Area, H. A. W. Forbes, B.M., B.Ch., M.R.C.P. Consultant Pathologist to Plymouth Clinical Area, G. A. Cary Lynch, M.D., D.P.H.

BIRTHS, MARRIAGES, AND DEATHS

BIRTHS

- Black.—On February 18, 1952, in Birmingham, to Dr. Margaret Black, wife of Dr. Alan Black, a son.
- Patey.—On March 4, 1952, at Paignton Hospital, Devon, to Jean Patey, M.B., F.R.C.S.Ed (formerly Mason), wife of John Patey, a sister for Robert and Johnny.
- Rees.—On February 28, 1952, at Moorlands Maternity Home, Dewsbury, Yorks, to Marie, wife of Dr. D. F. Rees, twin sisters for Patricia.
- Shribman.—On February 25, 1952, at Victoria Hospital, Barnet, Herts, to Hazel, wife of Dr. Irvine Shribman, a son—Jonathan Howard.

DEATHS

- Bull.—On February 29, 1952, at Bedford, George Coulson Robins Bull, M.B., F.R.C.S., L.D.S., aged 94.
- Findlay.—On February 21, 1952, John Findlay, M.B.E., M.D., of 14, Chada Avenue, Gillingham, Kent, formerly of Peterhead.
- Green.—On February 25, 1952, in a London nursing-home, Frederick James Green, M.C., M.D. late of 9, Old Burlington Street, London, W., aged 83.
- Murphy.—On February 23, 1952, Lionel Calbeck Esmonde Murphy, L.R.C.P.&S.I. & L.M., aged 74.
- Power.—On February 28, 1952, in London, Michael Patrick Power, O.B.E., M.C., L.R.C.P.&S.Ed., L.R.F.P.S., Colonel, late R.A.M.C., of the Naval and Military Club.
- Preston.—On February 23, 1952, at his home, Redlands, Mansfield Woodhouse, Notts, Harold Braycott Preston, L.M.S.S.A.
- Skevington.—On February 29, 1952, at Belmont, 15, York Road, Windsor, Berks, Sir Joseph Oliver Skevington, K.C.V.O., F.R.C.S., aged 79.
- Walsh.—On February 24, 1952, in London, John Walsh, M.B., B.Ch., Major, R.A.M.C., retired, late of Classis, Ballincollig, Co. Cork, Eire.

Any Questions?

Correspondents should give their names and addresses (not for publication) and include all relevant details in their questions, which should be typed. We publish here a selection of those questions and answers which seem to be of general interest.

Visiting Children in Hospital

Q.—Is it true that there is good evidence to show that serious psychological harm may occur to young children in hospital, especially if they are not visited regularly by their parents? If so, can the policy of denying such visits to the patients in fever hospitals still be justified?

A.—There are really several parts to this question, of which the first is 'whether separation from their parents causes psychological harm to young children. It is quite evident that it does upset some children, and they may show this at the time or on their return home. The second part of the question is whether the harm done is serious and long-lasting; there is fairly good evidence that this may be so, but by no means in the majority of infants. It is probable that serious harm is more likely to occur when separation is prolonged and in infants round about the small toddler age. It is more likely also where there is already some emotional disturbance in the home, or lack of a stable background. Thirdly, does frequent visiting diminish this risk? There is little doubt that frequent visiting increases the happiness of most children in hospital, so that it may be expected to diminish any harm that may come from separation; the value of weekly or less frequent visits must be more doubtful.

The final question is whether the possible harm done by separation outweighs the objections to visiting. The latter include such things as the increase in the strain on the nursing and cleaning staff caused by frequent visitors, and the risks of cross-infection where wards are open and the age groups mixed and where perhaps there is already some overcrowding. The effect on children who cannot be visited and the effect of the extra travelling on parents and transport must also be considered. In a fever hospital the question of the spread of infection by visitors and the maintenance of barrier nursing require consideration before visiting can be encouraged. It seems reasonable to say that frequent visiting seems good in itself and should be permitted, at least on an experimental scale, wherever conditions make it possible. It might be found impracticable in some hospitals, and it would then have to be stopped. It must not be forgotten that, as life in hospital can never be right for children, the aim must always be to return them home as soon as possible, and visiting must remain a secondary consideration to other medical and nursing requirements.

Dangerous Hypotension after Anaesthesia

Q.—After a general anaesthetic, when the mask is removed from the patient's face there is a marked fall of blood pressure due to the anaesthetic and independent of the surgical manipulation. What is the cause of this fall of blood pressure? How may it be prevented?

A.—The following are a few of the reasons why the blood pressure sometimes falls when the anaesthetic and the operation come to an end: (1) Stimuli from the operation field may have been reflexly keeping up the blood pressure. (2) The anaesthetic itself, particularly ether, and probably others too, may reflexly raise the blood pressure by stimulating nerve endings in the respiratory tract or the circulatory centre. (3) Carbon dioxide accumulation during the operation may keep the blood pressure up. This is found commonly when the semi-closed method is used. With gas-flow as low as 6 to 8 litres per minute there is

almost invariably some degree of re-breathing. In closed-circuit anaesthesia unsuspected partial exhaustion of the soda lime may occur. (4) With anaesthetics which depress the respiration, such as cyclopropane and thiopentone, or when relaxants are used, the ventilation may be insufficient for adequate carbon dioxide clearance and carbon dioxide accumulation occurs. (5) The volume of dead space may unsuspectingly be sufficiently large to cause some carbon dioxide accumulation.

All these causes cease to operate when the mask is taken off the face, and sometimes the resultant drop in blood pressure may be sufficiently severe to give the appearance of shock. The phenomenon may to a large extent be prevented by careful attention to adequate ventilation and carbon dioxide clearance throughout the operation, and to the correction of any chemical or physical factor in the apparatus which might hinder this.

Neonatal Priapism

Q.—An infant delivered by caesarean section had a constant priapism for the first 14 days of life; the priapism is now intermittent. The baby in other respects appears quite normal, except that it needs circumcision. What is the likely cause of the priapism? What investigations, if any, are indicated? What are the prognosis and treatment?

A.—Priapism is a not infrequent occurrence in the newborn period and is usually without significance. It occurs independently of the method of delivery, and is most unlikely to be an indication of spinal cord damage or local trauma in the case quoted. "Constant" priapism is said to have been present for 14 days. This is unusual, but a highly active reflex from the skin could quite easily cause an erection each time the infant was examined.

No investigations are indicated: no treatment is necessary: the prognosis is good.

Home-made Hair Oil

Q.—Can you suggest an inexpensive prescription for a hair "fixative" for men?

A.—A satisfactory preparation for those who prefer a non-greasy hair fixative is as follows: Powdered tragacanth 1.2%, alcohol 15%, glycerin 10%, water to 100%, perfume and preservative as required. A suitable preservative is 0.1% chlorocresol or the "solution for eye drops" of the *National Formulary*. For those who like a greasy preparation 10% of arachis or olive oil may be added to this formula. Further information may be obtained from *Modern Cosmetology*, by Harry (Chapman and Hall, 1944).

Does Agene Destroy Vitamins in Flour?

Q.—Has the agene process any effect on the vitamin content of flour, whether the vitamins are derived from the cereals themselves or are supplements?

A.—The most obvious effect of agene (NCl_3) on flour is to reduce the yellow carotenoid pigments naturally present to about one-third of the original level, but as these are mostly xanthophyll, which is inactive as pro-vitamin A, this loss is of little importance from a nutritional standpoint. In the vitamin-B group there is probably some loss of riboflavin, but most of the other members are more stable. Probably vitamin E is reduced. The question of the vulnerability of added vitamins is difficult to answer. In Britain flour is not fortified with vitamins, while in the U.S.A., where vitamins are sometimes added, agene has been banned. However, it should be practicable to add unstable vitamins after the inactivation of the improver by the bulk of the flour. The action of agene in producing "hysteria" in dogs, of course, is due to the formation of a toxic substance rather than to the destruction of vitamins.

Endocrine Therapy of Delirium Tremens

Q.—I have heard it said that adrenocorticotrophic hormone (A.C.T.H.) and cortisone can cut short an attack of delirium tremens. Is this true? If it is, how should the treatment be given?

A.—A considerable amount of evidence has accumulated to suggest that A.C.T.H. and cortisone may have a dramatic effect in cutting short an attack of delirium tremens. Both drugs will have to be used with great caution in such a condition, however, as delirium tremens is not infrequently associated with cardiac embarrassment which will be exacerbated by such therapy. Further, delirium tremens may be precipitated, as it often is, by an infective illness, and again acute infections may be aggravated by cortisone and A.C.T.H. In the treatment of delirium tremens A.C.T.H. is probably preferable to cortisone. A suitable dose would be 25 mg. six-hourly.

NOTES AND COMMENTS

Boy or Girl?—Mr. D. INNES WILLIAMS (London) writes: Many of your readers will have been interested in the case of the infant with an absence of the scrotum ("Any Questions?" February 9, p. 340). It is disappointing, however, to find that your questioner is advised to embark on endocrine therapy without any attempt to establish the diagnosis by ordinary clinical investigation. A simple rectal examination, to those accustomed to the procedure in infants, is capable of giving a great deal of information regarding the anatomy of genital passages: moreover, with instruments now available, urethroscopy is now possible at a very early age, and is of the greatest assistance in determining the sex in doubtful cases. The latter point is dealt with fully in a paper of mine now awaiting publication.

Emetine and Scorpion Stings.—Dr. C. HOLLINS (Dorchester) writes: I agree that intramuscular emetine is useless for scorpion stings ("Any Questions?" February 16, p. 396), but emetine injected at the site of the sting is an excellent remedy. I once did a controlled experiment (with the patient's consent) by first injecting saline at the site of the scorpion sting; the pain was aggravated. I then injected emetine and the pain was immediately relieved. The sting was on the foot, and there was already considerable pain in the inguinal glands. This pain disappeared a few minutes after the pain at the site of the sting. I have not noticed this effect with procaine, but pain in the regional lymph glands is unusual anyway.

Dr. H. ABDALLA (London), after stating that emetine was used in the Sudan for treating scorpion stings, writes: Injection of 1 gr. (65 mg.) emetine hydrochloride intramuscularly, or the local injection into the sting site of much smaller amounts (which may be as small as 1/16 gr. (4 mg.)) diluted with distilled water, causes immediate cessation of pain and all other symptoms of the sting. It is superior to local analgesic infiltration in that the latter has to be repeated in from 15 minutes to two hours and is of no use once the symptoms of shock have been established. As regards antivenin treatment, factors of supply, storage, climate, etc., continue to stand against its general adoption throughout scorpion-infested areas.

Notification of Pemphigus Neonatorum.—A MEDICAL OFFICER OF HEALTH has written to point out that the councils of some districts have under Section 147 of the Public Health Act, 1936, declared pemphigus neonatorum ("Any Questions?" February 23, p. 448) to be notifiable in their areas.

Correction.—Dr. CHARLES NEWMAN (dean of the Postgraduate Medical School of London) asks us to point out that the British Postgraduate Medical School is now termed a Federation, of which his school is a constituent, and that it is the Federation as a whole, and not his school, which is discussed in our annotation (March 1, p. 479).

All communications with regard to editorial business should be addressed to THE EDITOR, BRITISH MEDICAL JOURNAL, B.M.A. HOUSE, TAVISTOCK SQUARE, LONDON, W.C.1. TELEPHONE: EUSTON 4499. TELEGRAMS: Aitology, Westcent, London. ORIGINAL ARTICLES AND LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated. Authors desiring REPRINTS should communicate with the Publishing Manager, B.M.A. House, Tavistock Square, W.C.1, on receipt of proofs. THE FRENCH HEALTH SERVICE

BY

PAUL CIBRIE, M.D.

General Secretary of the Confédération des Syndicats Médicaux Français; Member of the Council of the World Medical Association

This article does not claim to be comprehensive but merely to indicate to British doctors the functioning of the medical part of the social security system in France to-day, and, in view of the national characteristics of the two countries, the reasons why we do not wish to introduce a system similar to the National Health Service.

Social insurances were created in France by a law dated April 30, 1930. This law was valid until October 19, 1945, when another was passed (the Social Security law) which has considerably extended the preceding one and introduced certain modifications which have given rise to violent protest by the medical profession. Doctors in France, however, all agree on the high import of the law and, in endorsing it, appreciate the noble end it sets out to achieve. Their criticisms, therefore, bear only on points of detail which we shall indicate in the course of this article.

Scope and Contributions

The risks covered are illness, disablement, old age, death, maternity expenses, accidents at work, and family allowances.

Insurance is compulsory for all who work for an employer, whatever the kind of work or remuneration. Only the working member of the family contributes, and this one contribution covers all members of the family—husband or wife, children under the age of 16 who are not earning, and any relative by blood or marriage who lives in the same house and devotes himself or herself entirely to work in the home and the education of at least two children under the age of 14 who are dependent upon the insured person.

The contributions, which at the present moment constitute the sole resources of the social security system, are made up as follows: the worker pays 6% of his salary (this is deducted at source by the employer), and the employer pays 10% salary for sickness insurance, 16% salary for family benefits, and a percentage varying from 1 to 8%, according to profession, covering the risk of accident at work, making the total contributions paid by both worker and employer about 39 or 40% of the salary earned. There is, however, an income level above which the contribution does not increase. At present it is 420,000 francs (approximately £420), and is revisable and fixed by the Government.

ADJUDICATION MARCH 18

The adjudication has been postponed to begin on March 18 because of the illness of counsel (see page 97).

PUBLIC HEALTH AWARDS

Local authorities continue to implement the Industrial Court Awards for public health M.O.s. For the latest reports see page 97.

The local offices under State control are responsible for all the administration within the framework of the law. The Social Security Agency is "a private body charged with a public service."

Benefits

"The insured person is free to choose his doctor"—this vital sentence appears in Chapter 1 of the law. It represents one of the fundamental demands of French medical men, who translate it by the words "freedom of trust." The insured person does not choose his doctor for a complete year or even for a shorter fixed period; he may at any time, even in the course of one illness, consult another doctor. It is therefore up to the doctor thus chosen to observe the rules of confraternal courtesy set out by our code of medical ethics (Code de Déontologie).

The basic principle of the scheme is that the patient pays the full doctor's fee and the full cost of medicines; he then claims for these expenses and receives, in general, up to 80% repayment from the local office.

Drugs, appliances, and laboratory tests are freely prescribed, and doctors are requested, in the text of the law, to exercise the greatest economy compatible with effective treatment. Proprietary products are paid for by the scheme if they are included in a list prepared by a permanent commission on which are represented the medical unions, the manufacturers, the Ministry of Labour and Social Security, the administrative council of the funds, etc. This list in fact contains all useful proprietaries costing slightly more than pharmacopoeial products of the same nature. All the vaccines, sulphonamides, and antibiotics may be prescribed. The list contains nearly 15,000 proprietary medicines, and there is thus complete therapeutic freedom. This freedom was likewise insisted upon by the medical unions.

The daily sickness benefit payments, in principle equal to half the daily salary on which the contribution is based, are made only to the person insured and not to members of the family.

Fees Paid by Patient

The doctor's fees are paid direct by the patient—except in cases of free medical attention or accident at work.

How are these fees established? Under the law of 1930 the fees were not determined, doctors requesting only the very lowest fee of their usual rates from those then insured, who were all low-paid employees or workmen. The present law (1945) having laid down the principle of an 80% reimbursement of fees—sometimes 100%—it was obviously necessary to fix the fees themselves. The law instituted a system of agreements or covenants by counties—medico-financial social security commissions. At present about 60 of the 91 counties follow this system of agreements. The county medical unions are, however, left free to sanction, or not to sanction, the covenants—whether from principle or inability to reach agreement. In these cases a national commission, of which representatives of the medical unions form one-third, set up a scale of fees which must stand. The law allows these fees, legally compulsory, to be exceeded when the financial situation of the patient, the renown of the doctor—generally university or hospital qualifications—or special circumstances enter into consideration. These are the three legal exceptions. For such cases 80% of the recognized rate is defrayed and the insured person himself is responsible for the extra.

As regards the payment of fees, or cases of abuse in the treatment or the issuing of prescriptions, litigation may arise promoted either by the insured person or by the sickness fund. These cases are judged by the regional councils of the L'Ordre des Médecins (exclusively professional jurisdiction) with the possibility of appeal before a special national commission composed of a councillor of state, who acts as president, two medical representatives, and two representatives of the social security financial organization. To date cases coming before these two bodies have been extremely rare in view of the numbers of doctors and insured persons.

Rates of Payment

Respect for professional secrecy is assured by the fact that the information given by the doctor on the medical certificate never contains any diagnostic indications. It was, however, obviously necessary to have an assessment which enabled the funds to apportion payments in accordance with the value of the medical attention without its being divulged. The answer to this problem was found in a system whereby a classification is given, followed by a coefficient—the list of all treatments applicable is included in the *Nomenclature of Medical Treatments*. The doctor indicates the nature of the attention given on the certificate that the patient has to send to the fund in order to be repaid: single consultation; C; home visit, V; operations, K.

To this key letter K—to which the agreement between the unions and the fund allots a fixed value—for example, K=200 (the present figure)—is added a coefficient which marks the value of the operation. For instance, appendectomy is assessed K50, which means that the fund must reimburse 50×200 francs, making 10,000 francs. The doctor must by law ask this fee except in the legal exceptions referred to above. As a certain number of treatments both for the same and for different illnesses carry the same coefficient, secrecy is maintained—with verification if the need arises only by a doctor, who must himself keep the secret.

Maternity insurance covers medical and pharmaceutical costs, equipment, and hospitalization incurred during pregnancy, confinement, and subsequently. The insured person or his wife does not have to pay even 20% of these expenses.

Old-age insurance provides a pension for the insured person on his reaching the age of 60. On his death a lump sum is paid to those entitled to it, based on the figure $90 \times$ basic daily income. A widow dependent on a retired insured person is paid 50% of his pension, with a bonus of 10% if she has had three children. This allowance is stopped on remarriage.

Risks are covered (including the payment of a daily allowance for the insured person himself) for a period of

six months—when the illness is one and the same. Beyond this period the insured person can be paid according to one of the two following rulings: either that for long-term illness, which may be continued for three years (this on principle is reserved for those who are curable—i.e., likely to get better within three years), or that for disablement when working capacity is reduced by two-thirds. Numerous arrangements regulate the various administrative problems raised by the application of the law.

Criticisms of the Present System

The present deficit in this medical insurance scheme—a difficulty experienced in other countries as well—is now forcing the French Government and Parliament to consider modifying the law itself in order to re-establish a balance.

Doctors realize the need for this modification. They want to help as far as they can, but they mean to defend, as in the past, respect for the dignity of the individual. They intend also that the practice of medicine shall retain its characteristic freedom.

At present great difficulties beset the establishment of agreements between the medical unions and the local agencies. These difficulties arise naturally from the fact that the agencies' interests, in so far as economy is concerned, are opposed to those of the medical men. These medical interests, however, uphold demands which are perfectly reasonable for the fixing of the recognized fees. The fees, once the covenant is signed, are compulsory for all the doctors in the area, and may be exceeded only for the reasons given above. When there is no covenant a national commission, of which doctors form one-third, fixes the rates. In fact, when the controlled rate thus introduced comes into force, doctors claim fees relatively high compared with this over-meagre rate, and as a result the patient has to pay 40 or 50% extra, although the law provides only for a 20% payment on his part for fees or medicines—in principle at any rate.

It should be noted that in cases where treatment is costly—major operations, for example—all expenses are refunded. On this particular point, considering the difficulties of reaching agreement, the medical unions propose that compulsory tariffs should be instituted only for low-wage earners—for instance, all those who earn less than the ceiling at present fixed at 420,000 francs a year. In this case the fees would be unregulated for insured persons earning more than this sum.

Amendments Wanted

The medical profession in France is particularly keen on direct patient-doctor fee payment, but it is obvious in many cases, certain costs being extremely high, that the low-paid patient is unable to advance the money, as repayment is often not made until several weeks after the outlay. This is why we are pressing for arrangements to be made for the estimated costs to be paid out to the insured person in advance. This arrangement, moreover, was allowed by the previous law. If the Government and Parliament, requested to modify the present law, follow our suggestions, the insured persons in this category would obviously be repaid at least 80% of all expenses, and this arrangement is particularly desirable from both the social and the humane points of view.

The medical unions have on many occasions pointed out all the reasons in favour of the present system—that is to say, the fixing of fees between doctor and patient—because in this way the patient retains both the idea that he has himself freely chosen his doctor and also his sense of personal responsibility. They have in addition pointed out the inevitable abuse that could arise were this system not observed.

Doctors also propose a certain number of modifications which seem indispensable to them: the improvement of the medical control—at present a number of doctors are

employed by the scheme to examine a certain proportion of patients who have been ill for some time as a check on both the honesty of the patient and the quality of the doctor's treatment—more effective preventive medicine, improved conditions of hospitalization with strict control over the length of a patient's stay in hospital, and a certain number of other smaller changes.

Is a National Health Service Possible in France?

Some politicians and trade unions advocate the establishment in France of a national health service rather like the Health Service in Britain, but perhaps with the patient paying a certain proportion of the fees and expenses. The *Confédération des Syndicats Médicaux Français* refuses categorically to entertain the idea of this system. (But first we should make it clear that we have no intention of either criticizing or discussing the functioning of the N.H.S. in Britain. It is entirely up to the British medical profession and the B.M.A. in particular to evaluate, approve, or criticize their national system. The ideas set out here are those only of a French doctor in relation to a system of social security which some people would like to introduce in his country.)

The national health service of which we are speaking would in point of fact be only the extension to the whole of France of what already exists on a small scale as the Mines Medical Service (*la Médecine des Mines*). Our miners are affiliated to a special social security fund, known as the Miners' Aid Fund (*Caisse de Secours des Ouvriers Mineurs*). The doctors are recognized by the fund and receive a salary based on the number of subscribers—which is very similar to the English system—each doctor holding a certain number of cards, each representing a miner and his family, whom he must attend. He receives a fixed amount annually for each card. The miner enjoys free treatment and medicine, and the doctor must answer the call of all his patients whether they are ill or supposedly so.

We often admire the respect for the law shown by our English friends. We ourselves, doubtless because of "French individualism," cannot count upon any such feelings. We French like to exercise all our rights, and even more than in England, the unnecessary summoning of the doctor, particularly if the service were entirely free, would rapidly develop into a constant abuse. The result would be that every practitioner would have to see a large number of patients to whom he could not possibly devote sufficient time for proper treatment. It would be conveyor-belt work, without technical value. It would result in the impossibility of any personal perfection, and finally a bad medical service which would soon have a disastrous effect on public health. These are the principal reasons underlying the opposition of the French medical profession. It is because we have had experience of this system for many years that we are able to appreciate its grave disadvantages. Shall we have to enter into a serious struggle, which would be led by our medical unions, to avoid this transformation in the social security scheme? This possibility is quite likely, and may soon arise.

The medical unions united in our confederation represent nearly all practising doctors. Of course the bonds slacken during long periods of calm, and the fighting spirit wears off, but as soon as a grave threat appears we are on the defensive, and present a united front to our adversaries.

We are quite aware that our present national system has room for improvement, and that it is necessary to better it; from now on we shall make several suggestions for the sickness insurance section. We offer our loyal co-operation and we like to think it will be accepted. The social security scheme can give of its best only if its administrators and the doctors trust one another. We are the essential technical agents of the most important branch of the social security system—the sickness branch. It would be a monumental mistake to make enemies of us, and we do not think this mistake will be made.

ADJUDICATION MARCH 18 COUNSEL FOR THE ASSOCIATION

The date when the adjudication begins has been postponed to March 18 because of the illness of counsel.

An emergency meeting of the General Medical Services Committee, to which the members had been summoned by telegram, was held on March 6 consequent upon the intimation that one of the leading counsel briefed by the Committee in the forthcoming adjudication was ill and would be unable to open the case before Mr. Justice Danckwerts on March 12. Dr. S. WAND presided, and Mr. Leigh Taylor, of Hempsons, the Association's solicitors, was in attendance.

The Committee agreed unanimously that the proceedings must not be delayed, and on the suggestion of the solicitor also agreed to invite Mr. Frederick Grant, Q.C., to fill the place of counsel who had fallen sick. In view of the extreme complexity of the case counsel would have to present; it was understood that the adjudicator would not object to a postponement of a few days. The Committee decided to leave this question to its chairman and to counsel for decision with the adjudicator.

It was agreed that the profession should be informed of what had taken place, also that the ordinary meeting of the Committee which had been fixed for March 20 should be held as arranged, even though the adjudication was proceeding at that time, in order that other urgent business might be taken.

PUBLIC HEALTH AWARDS

FEW AUTHORITIES NOT HONOURING THEM

Appeals on Behalf of M.O.s

During recent weeks appeals against 24 authorities have been notified. The appeals vary in that they cover in some cases only one medical officer, in others several or all medical officers employed by the authority concerned. The situation as at March 1 was as follows:

Eight local appeals had yet to be heard. These were: Renfrew County Council (one M.O.), Fife County Council (one M.O.), Halifax County Borough (one M.O.), Dundee County of City (one M.O.), Ilkeston Municipal Borough (one M.O.), Morpeth Municipal Borough (one M.O.), Newbiggin-by-Sea Urban District Council (two M.O.s), and Brierley Hill Urban District Council (one M.O.).

Of the 16 local appeals already dealt with, seven resulted in the acceptance and implementation of the awards. These are: Wiltshire County Council (one M.O.), Bristol County Borough (certain M.O.s), Middlesbrough County Borough (all M.O.s), Stoke-on-Trent County Borough (all M.O.s), Coatbridge Large Burgh (one M.O.), Chesterfield Rural District Council (one M.O.), and Masham Rural District Council (one M.O.). Nine appeals, having been refused at the local level, were notified by the B.M.A., the "professional organization," to the appropriate regional appeals committee.

Of the nine regional appeals, six had been heard, and the ruling of the committee was in favour of the medical officer(s) concerned in these five cases: Derby County Council (all M.O.s covered by first award), Staffordshire County Council (two M.O.s), Leicester County Borough (three M.O.s), Northampton County Borough (one M.O.), and Hornchurch Urban District Council (one M.O.). In one case—Bolton County Borough (one M.O.)—there was not agreement in the regional appeals committee, but the matter has been settled satisfactorily on the advice of Whitley Committee C. The remaining three regional appeals—Birkenhead County Borough (one M.O.), Blackburn County Borough (two M.O.s), and Gateshead County Borough (all M.O.s)—are to be heard in the near future.

No advertisement is accepted for publication in the *British Medical Journal* from authorities who have failed to accept

and implement the awards. This refers to all authorities who are the subject of an appeal, together with those authorities who are still considering the awards and have not yet accepted them. This number is small, compared with the large number of authorities who have accepted and are honouring the awards as recommended by Committee C.

The local health authorities who had yet to come to a firm decision were Norfolk County Council (one M.O.), West Riding County Council (one M.O.), Dudley County Borough (two M.O.s), Grimsby County Borough (one M.O.), Leeds County Borough (certain M.O.s), St. Helens County Borough (all M.O.s), South Shields County Borough (all M.O.s), Tynemouth County Borough (all M.O.s), Warrington County Borough (certain M.O.s), West Ham County Borough (two M.O.s), and Newcastle County Borough (two M.O.s).

IMPLEMENTATION OF AWARDS

More local authorities continue to implement the public health awards of the Industrial Court. The following figures show the percentages of authorities implementing the two awards as at March 5:

	1st Award	2nd Award
Overall position England, Wales, and Scotland	81%	85%
Counties England and Wales	97%	96%
Counties Scotland	93%	100%
County Boroughs	82%	86%
Counties of Cities	75%	100%
Metropolitan Boroughs	96%	50%
Municipal Boroughs	76%	89%
Large Burghs (Scotland)	100%	100%
Urban District Councils	76%	83%
Rural District Councils	79%	82%

PUBLIC HEALTH COMMITTEE

DUAL APPOINTMENTS

A meeting of the Public Health Committee was held on March 7. In the absence through illness of the chairman, Dr. C. Metcalfe Brown, to whom the Committee sent a sympathetic message, Dr. H. K. COWAN was elected deputy chairman.

The Committee considered at length the question of dual appointments, which had occupied it at the previous meeting. The views of the Central Consultants and Specialists Committee were placed before it together with a minute of the Joint Consultants Committee.

The CHAIRMAN said that a difficult position had arisen, and it was important to consider action which would reconcile so far as possible the views of all concerned. Dr. T. DAVIES, representing the chairman of the Tuberculosis Group Committee, said his committee had confirmed the views put forward by the Joint Committee.

After long and detailed discussion it was finally agreed that the matter be referred to the Council of the Association, with a recommendation from the Committee that consideration be given to the possible reference of this matter to the Whitley machinery. It was also agreed that the Association representatives should continue discussion with the employers' side with a view to clarification of the difficulties, and that a special meeting of the Public Health Committee should be called if any important turn of events took place.

Implementation of Awards

A report was made to the meeting on the present position with regard to the implementation of the two awards of the Industrial Court. A report on the position as at March 1 appears on page 97.

The Committee also considered certain individual cases of medical officers on whether there were grounds for appeal and gave advice on each case.

The "Closed Shop"

A verbal report was given on the position in County Durham. The SECRETARY said that a meeting of the professional associations concerned in the Durham dispute was held the previous week, and it had been agreed to set up a joint professional emergency committee with three representatives from each of the professions. A meeting of this new committee would be held in the near future.

It was also reported that the borough of Dartford had rescinded its "closed shop" resolution so far as medical officers were concerned.

Other Business

The Committee had before it exceptionally full agenda, embracing some 11 documents and 50 separate items. The consideration of several matters had to be deferred. One question referred to the General Medical Services Committee arose on the puerperal pyrexia regulations, following a letter protesting that the new regulations would mean many notifications without regard to practical value or clinical need. The Committee is suggesting to the G.M.S. Committee that further information is necessary and is asking whether this could be obtained through local medical committees.

Among other matters on which reports, correspondence, and other information were received and considered were vaccination and immunization fees, the question of the re-introduction of compulsory vaccination, the conditions under which a medical officer of health acts in the capacity of medical referee, advertisement of all county M.O.H. appointments, and Public Health (Leprosy) Regulations.

Another item dealt with the legal opinion regarding advertisements for mixed appointments. It was felt that further information was necessary, and this is now being sought.

The agreement between the B.M.A. and the Society of Medical Officers of Health embodied in these principles agreed over a year ago was again discussed, and representatives were appointed to attend a joint conference on this matter which is to be held in April.

THE ASSOCIATION AND PRIVATE PRACTICE

Certificates of Incapacity Required by Employers

The Private Practice Committee of the Association held a meeting on February 27, Dr. I. D. GRANT presiding. A report was given of a meeting which had taken place with representatives of the British Employers Confederation to consider the question of certificates of incapacity required by employers. The representative of the Committee who had attended (Dr. Morgan) said that the meeting was a useful one. It was pointed out that the insistence of some employers on medical certificates after only one or two days' illness was a burden on general practitioners, particularly in epidemics, and it was suggested that, instead of requiring such certificates, cases of workers frequently absent should be investigated by the welfare department. The reply of the employers was that the rate of absenteeism over the whole country was about 5%, involving many thousands of people daily, and welfare departments could not deal with such numbers. But the Confederation was prepared to advise its members to look upon the matter of these certificates as leniently as possible; in any case considerable latitude would be advised during epidemics.

At the same meeting the Confederation agreed to remit for the consideration of employers the suggestion that no new form of medical report or certificate should be introduced without prior consultation with the profession. This

matter has also been discussed with a representative of the Trades Union Congress, who said that certain unions had certificates and report forms which required completion before the member joined a sick-pay scheme. He was under the impression that these forms were quite straightforward and comparable to the forms already agreed between the Association and insurance companies.

Fees for Lectures

The Committee discussed a number of items referred back from the Committee on Fees for Part-time Work under Local Authorities. It was considered that the time was not opportune for seeking revision of the 1947 agreement on sessional fees. One item concerned fees for lectures. Recently Committee B of the Medical Whitley Council had agreed a new scale of fees for lectures to nurses by members of hospital medical staffs, 2 guineas being paid to consultants, 1½ guineas to S.H.M.O.s, and 1 guinea to other grades. The Committee felt that fees should be uniform irrespective of the status of the lecturer.

A letter was read from the senior medical inspector of the Children's Department of the Home Office concerning the minimum remuneration of medical officers attending approved schools. The Committee had previously suggested that the proposed new minimum of £40 a year for schools with up to 50 pupils would not be unreasonable provided the average time spent by medical officers on duties outside the scope of the N.H.S. did not exceed half an hour a week. It appeared that in some of the smaller schools, especially the girls' schools, more time had to be spent on such duties. The view of the Home Office was, however, that circumstances differed in each school, and that the only practical method of determining remuneration was to relate it to the average number of pupils.

Fees for Post-mortem Examinations and Inquests

Dr. F. E. CAMPS, honorary secretary of the Association of Forensic Pathologists, attended the meeting for a consideration of the question of fees for post-mortem examinations and attendance at inquests. He said that it was a matter of concern to anyone associated with the working of coroners' courts that the statutory fees laid down in 1926 were still in existence. This was partly because the terms of reference of the Lord Chancellor's Committee on Coroners did not allow any recommendation of increase of fees to be considered. The schedules of fees varied widely among local authorities, from that of Middlesex, which was adequate, to local authorities which had no schedule at all. A long discussion ensued, and it was suggested that an approach be made to the County Councils Association and the Association of Municipal Corporations and also to the Home Office with a view to getting these fees established on a satisfactory basis over the whole country. Accordingly a small committee was appointed, consisting of Dr. Camps, Dr. J. A. Gorsky, and Dr. R. Forbes, with a pathologist member of the Central Consultants and Specialists Committee, to consider the matter.

In accordance with a request made at a previous meeting of the Committee a statement of information obtained from the various area boards of the British Electricity Authority relating to the tariffs applicable to doctors' houses was laid before the Committee. It appeared that the majority of the boards regarded doctors' surgeries as domestic premises.

The Committee considered the action taken by the Ministry of Pensions in terminating the contracts of members of its boards who are over 70 years of age. It was the view of the Committee that the imposition of an arbitrary age of retirement for doctors in any of the various forms of private practice was to be deprecated, and a recommendation was framed to that effect.

The modified report form for pre-employment examination of prospective employees of N.A.A.F.I. was approved. The Institute has agreed to pay a fee of 10s. 6d. for such reports; previously it was 7s. 6d.

HOSPITAL ESTIMATES MORE LATITUDE ALLOWED

The Ministry of Health, in circular R.H.B. (52) 20, returns to regional hospital boards the power to approve the estimates of hospital management committees and to authorize transfers between subheads. The boards are thus to resume powers for a time exercised by the Ministry. These arrangements take effect for the estimates of 1952-3.

REGIONAL HOSPITALS' CONSULTANTS AND SPECIALISTS ASSOCIATION

The annual general meeting of the association was held at the Royal College of Surgeons on February 21. The annual report of the council, which had been sent to all members and which gave a résumé of the association's work during the year, was accepted.

The officers for 1952 are:

President: Mr. R. E. Jowett.

Honorary Treasurer: Mr. Kenneth Heritage.

Joint Hon. Secretaries: Mr. Nigel Cridland, Dr. Donald Wilson.

Trustees: Mr. Clifford Morson, Mr. J. R. H. Turton.

The president referred to the council dinner, held at the Royal College of Surgeons, which was made notable by the speeches of the Presidents of the Royal College of Physicians and the Royal College of Surgeons and the presence of the President of the Royal College of Obstetricians and Gynaecologists and the chairman of the B.M.A. Central Consultants and Specialists Committee.

The accounts showed a very satisfactory financial position.

The meeting approved alteration of the rule governing membership of the association to read:

There shall be individual membership; consultants and all senior hospital medical officers who are engaged exclusively in the practice of their specialty shall be eligible as members if they are in whole- or part-time contract with regional hospital boards, as well as those who, in the opinion of the council, are suitable as members.

The subscription for associate members was abolished.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Hackney, Southwark, Stoke Newington.

Non-County Borough Councils.—Crewe.

Urban District Councils.—Droylsden, Houghton-le-Spring, Huyton-with-Roby.

In future it will be left to the discretion of each ophthalmic services committee, in consultation with the local medical and optical committees, to decide whether the ophthalmic list should be sent to all general practitioners in the area. An alternative is to send amendments to the basic list. This arrangement, which would save money, is suggested in a Ministry of Health circular after consultation with the B.M.A., the Faculty of Ophthalmologists, and other interested parties. The Minister will also remove the obligation to send copies of the list and amendments automatically to hospital boards and committees on the understanding that the documents will be available to these bodies on request.

FURTHER SUCCESSFUL APPEALS

Three regional appeals were made under the Whitley regional appeal machinery recently where the Association made application with regard to the seniority of certain consultants. In each case the employing authority, the North-west Metropolitan Regional Hospital Board, had not afforded to the consultant full seniority as prescribed under the Terms and Conditions of Service—that is, dating from the acceptance of a hospital staff appointment with full clinical responsibility.

Two of these officers complained that their service as consultants under the E.M.S. had not been taken into consideration. In each case these consultants held senior-grade E.M.S. appointments—one as a surgeon and one as an orthopaedic surgeon. In the first stage of the appeals, when the individuals had themselves appealed under the provisions of the Whitley regional appeal machinery, it was made clear by the regional board that the E.M.S. appointments could not be considered as equivalent to consultant appointments. The board was told that the explanatory memorandum to the Terms and Conditions of Service (which was issued by the Ministry) specifically stated that boards should have regard to the date on which a consultant took up "a hospital (or E.M.S.) appointment of consultant status." But the reply was that the board had had regard to this but did not consider the appointments concerned were of consultant standing.

Unjustified Contention

On appeal, however, the board did not attempt to justify its contention, and evidence was brought to show that these E.M.S. appointments were those of evacuated teaching hospitals where the full run of major surgery was carried out in addition to the treatment of civilian casualties, and that the appointments were in every way comparable to normal senior staff appointments. Seniority was allowed in both cases.

The third appeal was on behalf of a consultant psychiatrist, medical superintendent to a large institution for mental defectives, to which he was appointed as acting medical superintendent in 1944. After the war this appointment was advertised and he was formally appointed as superintendent. (All such appointments were made on a temporary basis during the war.) In this case the regional board had afforded the consultant seniority only from the date of appointment as medical superintendent, ignoring the fact that he had for four years carried out the same duties at the same hospital in an acting capacity. Again the board did not attempt to justify its decision, which was contrary to the Terms and Conditions of Service. These lay down that seniority should be calculated from the date on which the consultant "first accepted a hospital staff appointment with full clinical responsibility."

Protest at Slowness

These three appeals illustrate the value of the Whitley regional appeal machinery. In each case the appeal has been on the interpretation of facts.

The B.M.A. has protested to the Ministry of Health against the slowness of the North-west Metropolitan Regional Board in accepting the appeal machinery laid down by the Whitley Council. These cases have only now been heard—a year and a half since the establishment of the appeal machinery.

This board has created difficulties for a number of its officers—first of all by delaying the application of the Whitley appeal machinery, and then by refusing to give the officers any reason for rejection of their claims.

Two National Insurance intermediate certificates are to be amalgamated into one. These are Form Med. 7 (hospital intermediate certificate) and Form Med. 8 (hospital special intermediate certificate). Form Med. 10 will replace these from March 31.

BRITISH MEDICAL ASSOCIATION AND IRISH MEDICAL ASSOCIATION

JOINT ANNUAL MEETING, DUBLIN, JULY, 1952

Dates of Meetings of Scientific Sections

Medicine	Two sessions	July 10 (p.m.)
		July 11 (a.m.)
Surgery	" "	July 9 (p.m.)
		July 11 (a.m.)*
Obstetrics and Gynaecology	" "	July 11 (a.m. and p.m.)
Anaesthetics	One session	July 9 (p.m.)
Cardiology	" "	July 9 (p.m.)
Child Health	" "	July 10 (p.m.)
Ophthalmology	" "	July 11 (p.m.)
Orthopaedics	" "	July 10 (p.m.)
Oto-rhino-laryngology	" "	July 9 (p.m.)
Pathology	" "	July 10 (p.m.)

Tropical Medicine	" "	July 11 (p.m.)

*Amended time.

Detailed programmes of the Sections will appear in a later issue.

SCIENTIFIC EXHIBITION

A Scientific Exhibition will be staged in the Convocation Hall of University College, Dublin, from July 8 to 11 in connexion with the Joint Annual Meeting of the British Medical Association and Irish Medical Association.

Applications for space at the Exhibition, which must be accompanied by brief details of the proposed exhibit, should be received *not later than March 31* and should be addressed to the Organizing Committee, Scientific Exhibition, Irish Medical Association, 10, Fitzwilliam Place, Dublin.

Each stand will be 10 ft. wide and 6 ft. deep and the walls will be 8 ft. high. The front will be open, and a shelf 2 ft. 6 in. above the floor and 1 ft. wide will extend all round the three walls. Chairs will be provided if required. Fluorescent lamps will be fitted to the walls but can be omitted if exhibitors require indirect lighting for show-cases, transparencies, etc. The current is A.C. 200-240 volts.

The exhibitor will be expected to pay the cost of the preparation, transportation, and installation of his exhibit, but no other expense will fall on him unless he requires alterations to the booth or special construction. Although it is hoped that the latter may not be required, any special demands will be dealt with sympathetically so far as possible. The cost of such alterations will be borne by the exhibitor.

No motion pictures will be shown in the booths, but separate arrangements will be made for these elsewhere. Exhibitors are expected to provide their own transparency cases for slides or x-ray films. There is ample free storage space for packing-cases.

Exhibits should be shown in the name of an individual person (or persons), who must be a member attending the Annual Meeting. The name of the hospital or institution at which he works may appear as part of the address.

The booths will be ready for the installation of exhibits by *Sunday, July 6*. Installation should be completed by *6 p.m. on Monday, July 7*.

Heard at Headquarters

Holiday Exchange

A French doctor in Algeria would like to get in touch with an English family with a view to arranging a holiday exchange for his 14-year-old son and 15-year-old nephew, or to send them to a doctor's family in this country for a month as paying guests. Would anyone interested in this request please write to Dr. Sandiford, International Medical Visitors Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

N.A.D.

Correspondents sometimes take us to task for allowing incomprehensible groups of initials to appear in the papers we publish. Quite rightly so, for even initials whose meaning is well known in Britain may be strange to one of our many foreign readers. The medical profession, like the armed Forces, seems to have a predilection for initials, no doubt because they save time. But their use can be carried too far. A doctor now sends us two communications he received from a hospital. They summarize the details of treatment that two of his patients received. In the first, under the heading "Treatment," is nothing but this cryptic statement: "B.A.P.W.O. and Ts and As." In the second, one of his patients is described as having had "P.I.A. by Mr. X under G.O.E. Anaesthetist Dr. Y."

News in the Local Press

The article we published in the *Supplement* of February 16 (p. 63) on getting news into the local press has brought a response from another lay journalist. In fact, he was prompted by it to devote a column in his newspaper to explaining the doctors to the public, and his account was both well-informed and friendly. In drawing our attention to this he agrees with the writer of our article, saying that doctors "would get sympathetic co-operation from local weekly newspapers all over the country" if the local P.R.O.s were to submit articles.

The Future of General Practice

Students from the London schools heard a wholehearted defence of general practice from Dr. G. O. Barber, of Great Dunmow, when he delivered his Metropolitan Branch lecture at B.M.A. House. Dr. Barber roundly declared that he had no doubt at all about the future of general practice. The general practitioner, he said, never stood higher than he did to-day, and there is nothing in our economic set-up or in the National Health Service to prevent the very best in the old relationships of general practice continuing happily as before. His reason for this confidence? Whatever the devices of the politicians or the plans of the planners or the regulations of the Civil Servants, it is the public who makes the final decision, and the public has shown unmistakably that it wants a family doctor at the hub of the Service. The patient, said Dr. Barber, wants to be treated as a person, not as a sickness unit, even with pin-point diagnosis and automatic treatment. He wants someone to treat him who knows his background, his peculiar troubles, perhaps his nagging wife, his uncertain future, his bad conscience. It is all very well to speak of the humdrum trivialities for which people seek their doctor; behind many of them there is some deeper trouble which the practitioner with sympathy and with leisure—and there's the rub!—can elicit. At the end of the lecture one student got up and asked how many patients a general practitioner can compass; he said that it had been impressed on him that a large practice was essential for economic survival. Dr. Barber could reply only that this was a personal matter. Every doctor would give a different answer. It depended a lot on whether it was a town or country practice, also on how hard the doctor wanted to work, the way he set about

his work, and what help he had. He had no doubt that some doctors—a few—could give a first-class comprehensive service with lists of 4,000, but others would find it impossible to be responsible for lists of more than 1,500. He agreed that one could never know more than a small number of one's patients really intimately.

Exchange of Roles

A medical practitioner was trying to interest a parson in a patient under his care. He told him that the patient was a man who needed spiritual guidance, that his soul was adrift, that some ministration of the Church was called for to direct his mind to eternal things. The parson's answer was remarkable. "He looks to me," said the parson. "like a manic-depressive."

Questions Answered

Service on the Reserve

Q.—(1) On completion of National Service, three and a half years have to be spent on the Reserve. Are income-tax expenses allowed during this time for cost of cleaning and general upkeep and perhaps a new uniform?

(2) Under the heading of expenses, it is stated that if you have to spend part of your pay on tools, explosives, or special working clothes fixed allowances have been agreed upon by the trade unions. In refitting oneself with "tools" for civilian life again, I should be obliged if you could list me those items for which one may claim.

A.—(1) There is a recognized scale of allowances for serving officers, which is presumably approved by the assessing authority for the Service concerned, that is intended to represent the additional cost which a serving officer incurs over and above what would be the corresponding expense in civilian life. The allowances are so much per annum—e.g., if an officer joins the Forces half-way through the financial year he would receive one-half the yearly allowance. On that basis the most that could be expected while in the Reserve would be the proportion of the 52 weeks which is spent on actual service.

(2) The annual allowances agreed with the various trade unions are understood to be for upkeep of tools, special clothing, etc., not for the original equipment of tools, etc. If the questioner was in civil practice before serving in the Forces, there would seem to be grounds on which he could claim to deduct the cost of making good such equipment as had deteriorated during his period of service. But there are possible legal objections, and we know of no case law which throws light on the point.

Ship Surgeon's Income Tax

Q.—I am a ship surgeon, and I have a number of special instruments of my own, the total original cost of which was about £100. Income tax in respect of salary is deducted at source, and I submit a separate return in respect of fees received from passengers. How much can I claim for depreciation?

A.—The questioner's earnings fall under two different schedules and accordingly are governed by two different sets of statutory rules—his salary falls under Schedule E and his fees under Schedule D. Depreciation is allowable only in respect of "plant and machinery," and the equipment in question hardly seems likely to qualify under that category. Consequently the point arising is whether he is entitled to deduct as an expense the cost of replacing such articles as occasion may require. That expense may broadly be said to be allowable so far as it relates to the earning of the fees, but not against the salary unless the employing company requires the maintenance of such equipment as a condition of employment.

Correspondence

Registrar Appointments

SIR,—The cut in registrars which takes effect in October will leave many hospitals short of surgical staff. Where an extra consultant is needed the remedy is plain, but in many cases what is wanted is a man who is on the spot all day and whose status makes it proper for him to feel a sense of responsibility for all the surgical cases in the hospital.

It appears that an important number of senior registrars will be unemployed and a proportion will find their way into general practice. Some of these will make a valuable contribution to this branch of the Service, but all of them will have gone through an expensive process of training of which fully economical use will not be made. They cannot be ploughed back into the hospitals at a lower grade because of the terms of appointment for intermediate registrars. At the same time the supply of intermediate registrars is perceptibly slackening, and we may in future years find ourselves short of material for filling consultant posts.

A few years ago, in the heat of the discussion about the provisions of the Health Service, the specialists in general thought it wise to resist the designation of a grade less than that of full consultant. I wonder whether the time has not now come to reconsider this decision. There is something to be said, in the surgical field at least, for the creation of an R.S.O. grade. Only after discussion can one appreciate all the implications of the formation of such a grade. As a basis for such discussion it would appear to me that the posts would need to carry with them permanent appointment to the Service. They would be intermediate, in grade and salary, between senior registrar and consultant. They would, in these respects, be not greatly different from the S.H.M.O. grade in other specialties, but they would ordinarily lead to full consultant appointments. This final step, I imagine, would not be guaranteed, and every now and again a man might fail to make the final upward step.

I believe that it is up to the profession in general, and the young men now at senior registrar level in particular, to make the first move, if they wish something of this type to happen. To me it seems the only logical solution of our present problem, and one which would supply the hospitals with much-needed key men, make appropriate use of admirable training posts, absorb a number of individuals who may otherwise become redundant, serve the public and the country well, and, finally, insure us against a shortage of young surgeons in the near future.—I am, etc.,

University of Liverpool.

CHARLES WELLS.

Registrar Establishments

SIR,—We have seen in the last few years many examples of how hasty conception and premature delivery have given rise in the hospital service to unexpected difficulties in the developing of well-intentioned plans. Is it too late to suggest that reconsideration be given to the formalizing and fixing of registrar establishments? So far as can be judged from what information filters out to the periphery, the new proposals look like being the source of even more unfairness and of being more hampering to freedom of training and development than the last. The one thing in their favour looks like being that they will cause less "trouble," as the turning aside from the goal will operate at an earlier, less articulate, and less certain stage of development.

Would it not be a great deal better to abandon the grade of senior registrar for the time being? There are many arguments in favour of such a course, but perhaps the most important is the fact that the hospital system has not reached that stage in its development which requires or can support the administrative tidiness of the new proposals. We all of us know how slow this development is for reasons of finance, of personalities, because of differences in interpretation of meanings, differences in ideals, and the dead weight of

established custom. Why not go a little slower with these proposals about establishment, which may further hamper the changes which are slowly occurring? Differences are being made between teaching hospitals and non-teaching hospitals, teaching hospitals and other teaching hospitals, and between one and another non-teaching hospital which cannot be justified as the semi-permanent measure they are supposed to be. Besides this argument—that the time is not yet ripe—many can be raised which suggest that the extremely sharp division between registrars and senior registrars may be permanently undesirable.

Surely it would be better to have some such flexible system as this:

All registrar appointments to have the same title. A minimum of five to six years in such appointments to be done before appointment to consultant grade would be considered. The maximum period to be allowed, eight to ten years. Salary to rise by yearly increments to a maximum as at present.

A regional (or perhaps a central) professional committee would fix the duration of each appointment. They should be for one or two years. A special extension would be granted to some special hospitals—e.g., thoracic surgery, neurology, neurosurgery, paediatrics—and perhaps at certain general hospitals (especially of teaching status) if the holder of the post had not held other appointments of similar rank at the same hospital. Some of the registrar appointments at special hospitals whose specialties form part of more general consultant practice—e.g., paediatrics, rectal surgery and genito-urinary surgery, and cardiology and dermatology—might be made half-time and combined with a half-time appointment at a general hospital.

This brief survey has been written largely from the point of view of general medicine and surgery, but in general it applies to most of the specialties.

It is difficult to ignore the fact that it does not take quite so long to train a competent anaesthetist, dermatologist, or E.N.T. surgeon as a neurosurgeon or a thoracic surgeon. Whatever the present regulations may say about equality, this difference is repeatedly recognized and accepted by selection committees. In some specialties it may be decided that a shorter period of registrars' appointments (five to six years) may suffice, while in others it should be accepted as being longer. In the hope of having this letter printed I have been brief and have omitted the individual arguments in favour of these proposed changes.—I am, etc.,

London, W.1.

ALAN SMALL.

Health Service Charges

SIR,—I think we are endeavouring to oversimplify the question of prescribing and its cost.

First, we must realize, despite statistics, that the health—feeling of wellbeing—of the nation is progressively deteriorating. Most people, though not ill in the medical sense, are endeavouring to feel better or well. People who feel well do not go to the doctor.

Secondly, under the Act the patient has been given full rights to anything that he considers will make him feel well or better, and the doctors have been allotted the duty of getting the patient better or well. He is our first and last consideration.

Thirdly, the population, by various means, know a great deal about the various drugs and their uses, and of x rays, barium meals, radiotherapy, physiotherapy, etc. It is no uncommon occurrence for a patient to walk into the consulting-room and ask for or demand a course of penicillin or "M. and B." or for an x-ray examination of his stomach, chest, or old rheumatic joints, or even for an electrocardiogram for his heart, which is playing him up. My experience is that seven or eight out of ten people who come to me come not for consultation but to get something, very often not for themselves but for a husband or wife or father or mother who is at work but wants something for a cough or indigestion or pain in the back or leg, etc. Are we, as G.P.s, to refuse the tonic or cough mixture or analgesic tablet? Again, what is the G.P. to do about the sometimes very expensive course of treatment with proprietary preparations prescribed by consultants? Are the consultants to be

directed by the Minister? I think we should be extremely careful about assuming any responsibility for banning any proprietary preparations. If the State is to standardize medicines and treatments it must be made to assume the sole and whole responsibility and not to throw it on to the profession.

Dr. L. S. Wolf (*Supplement*, February 23, p. 70) takes a rather oblique view of the increase in proprietary preparations. 'It is obvious that with medical science and research running at top speed more and more proprietary preparations will be placed at our disposal. Are they to be given a trial or banned right away? We are in no position to say whether any preparation is too expensive until we know the amount spent on research and putting the article on the market, and we would be presumptuous to say that anything which would give relief to, say, an asthmatic is too expensive. The reported statement by the Minister of Health that "the cost of medicines has risen enormously" is enormously out of court, as everything has risen enormously except the pay of the G.P. Cotton-wool, which pre-war sold for around 1s. per lb., was 11s. per lb. and is now 8s. per lb., and lint is now around 15s. per lb., to take but two articles whose daily consumption has always been enormous and always will be.

The question of 1s. per prescription is chiefly political, and we should not get involved in it. Parliament made its estimates of the cost of the Service. If it finds the cost too heavy it is the Government's job to find the money or reduce the Service, and we must not allow the politicians to put the onus on us to reduce the cost. We have already made our contribution by working the Service as well as it could be worked—for a pre-war rate of pay. It might be more advantageous to the Service to look into the cost of administration before reducing the cost of prescriptions.—I am, etc.,

St. Osyth, Essex.

R. E. CLARKE.

SIR,—The proposed tax on prescriptions simply dilutes the whole essence of a free Health Service. Dr. Frank Murray (*Supplement*, March 1, p. 82) hits the nail on the head when he says that the proposed tax on prescriptions infers criticism on the doctors who issue them. Of course he is right, but under the capitation system "the customer is always right," because having built up our lists we just cannot afford to lose them. What a soul-destroying position we are in. And I am afraid the only solution is the dreaded salaried service (adequately paid according to length of service and qualifications, irrespective of the number of patients).

This may not be too bad under the present Government, for, although we should be controlled, we should in turn control the patient in *his interests*, and we should no longer prescribe a lot of useless placebos, thereby drastically reducing the national expenditure. Our patients would soon be re-educated into this new era, and, what is more important, our prestige will have risen overnight. At present we are just "floundering to our doom in our self-created chaos."—I am, etc.,

Nottingham.

GORDON TRESIDDER.

Middle-class Practices

SIR,—Dr. I. E. D. McLean (*Supplement*, February 9, p. 55) suggests that patients should be allowed to contract out of paying their weekly contributions. Presumably he means weekly contributions to the National Health Scheme. This, however, is not a practicable proposition. Benefits under the National Health Act are not conditional on the payment of weekly contributions. For example, a newly born baby is immediately entitled to treatment and yet does not pay for a National Insurance stamp. Admittedly out of the total cost of the weekly stamp 10d. is allocated to the National Health Service, but this may cover a single person or a family of five; and the amount allocated to the National Health Service from this source represents less than 10% of the total cost to the country.

Dr. McLean is guilty of the misunderstanding deplored by Mr. Marquand in the *Journal* of February 2 (p. 272), that the National Health Service is paid for by the Insurance Fund. If Dr. McLean intends that patients should be allowed to contract out of the entire National Insurance stamp, they would of course have to forgo the benefits under the National Insurance Act, including sickness benefit, industrial injuries benefit, pensions, and unemployment benefits, etc. In any case Dr. McLean should know that patients are not compelled to avail themselves of the benefits of the National Health Act, and are expressly permitted by the provisions of the Act to contract out and become private patients if they so desire.—I am, etc.,

Liverpool.

MONTAGUE SOLOMON.

Trainee Assistant Scheme

SIR,—Recently it was suggested to me that the trainee assistant scheme was giving rise to adverse criticism. From recent letters in the *Journal* it would appear that this is justified. Particularly in England, the scheme seems to be abused. Lately my present trainee assistant has had some interviews in England with a view to obtaining a permanent position at the end of his year's training with me. He has told me of practitioners securing trainees at Government expense and making these assistants undertake most of the work; of practitioners securing sanction for trainees so that they can try out assistants and, if a suitable one is obtained, perhaps offer a permanent assistantship or partnership. Indeed, from time to time there are advertisements in the *Journal* apparently confirming that this is so. Many of these practitioners appear to have no scheme of instruction, and are not attempting to "train" the assistants. They are only doing it to see what the scheme will do for them. It would be a great pity for those of us who try to make the scheme a success to have it taken away by the abuse of a few—either by dropping it altogether or by allowing only two to three years' permission to each trainer.

I am now due to start my third trainee, and with the experience of the previous two I hope to make this young practitioner's time with me even more valuable to him.

There must be method in the usage of the scheme. The selection committees should be exacting in their choice of trainers. They should attempt to avoid any likely abuse of the scheme by the careful selection of their trainers. If any trainer is found to abuse the scheme, immediately his name should be taken off the list. Considerable time for training is necessary for the trainer. Therefore no practice with a very large list should be allowed to have a trainee—say more than 3,250 for an urban practitioner and 2,500 for a rural practitioner. In Scotland I believe the selection committees are very particular in their choice. Apart from not allowing a trainee to a practitioner with too large a list, some committees will not allow trainees to any practitioner who has previously employed a paid assistant. The idea is that if the practitioner could afford an assistant he should not now get one at Government expense. In parts of Scotland the selection committees have already introduced a ban on a practitioner's being sanctioned as a trainer for more than two consecutive years, though I do not agree with this where genuine training is given.

A selected trainer should follow a definite scheme of training. First, I should state I have a rural practice which I can work myself (perhaps at times a bit hard, but it can be done). Therefore I have no particular need for an assistant "to work for me." I have a definite scheme of training on which, to save space, I shall not elaborate. On engagement, I give the trainee all income that accrues to me under the scheme, so that I do not gain financially. And, of course, as a corollary, I try not to lose—e.g., by giving the trainee a car allowance, but by letting him pay his own car expenses. The advantages I gain are from companionship in the work of the practice and also, after the preliminary training, from the knowledge that I have someone in the practice who knows my patients and my methods if I am off for my half-day.

Last year I met an American colleague, Dr. Benson Roe, who was in this country studying our methods and the Health Scheme. During discussions about the Health Service I told him about the trainee scheme. He considered it one of the most important advantages of the scheme for the young practitioner. The Cohen Report advocates such a scheme. If properly carried out the scheme can be of immense value. It is up to the selection committees and selected trainers to see that it is so.—I am, etc.,

J. WATSON,
Honorary Secretary, Dumfries and
Galloway Division.

The General Practice of Medicine

SIR,—There is, I believe, a genuine wish to raise the status of general practice. It is hardly necessary to elaborate the reasons for this highly desirable objective. I would like to point out, however, that, as specialist knowledge in the medical world increases, the need for general practitioners of the highest order, who will regard the patient as a person as well as a collection of physical systems, becomes greater.

I have often found that well-meaning consultants condole with me over what they appear to regard as the depressed state of general practice. I venture to protest against this widely held view. The facts that better consultant services are available, and that many diseases can be better treated in hospital, do not lead to a lessening of the need for men of the highest order in general practice.

It is the purpose of this letter to attempt to show that the scope for good work in general practice is very great. The work of the G.P. is changing, but it demands greater care and higher qualities than it did 20 years ago, when the standard of medical care for the majority of people was lower. What, then, are some of the responsibilities and necessary qualifications of the good general practitioner?

First, he must have an adequate knowledge of all the branches of medicine—not of the rare diseases which affect the few, but of the common diseases which affect the many. He must know how to treat the upper respiratory diseases of children, the sinus and middle-ear infections; he must understand the management of infants. He must know which injuries justify an x-ray examination to exclude bony involvement; which cases of peptic ulcer would benefit by reference to hospital, which cases of rheumatic disease must be treated by placebos and analgesics, and which would benefit by reference to a rheumatologist or an orthopaedic surgeon. He must know what to do with the woman with a low backache—which is orthopaedic and which gynaecological—knowing full well that if he sends her to the wrong specialist she is only too likely to spend a very long time in treatment, or perhaps on a waiting-list, before it is discovered that such treatment is of no avail and the specialist of another department has to be consulted.

As specialist knowledge advances, so must that of the G.P. advance in all branches, so that he may be able to take proper advantage of the new knowledge. Advances in orthopaedics are a good example of this.

Secondly, the G.P. must have a good working knowledge of pharmacology. The analysis of prescriptions by Professor Dunlop and his colleagues (*Journal*, February 9, p. 292) shows clearly how great is the need for further understanding of the art of prescribing. The G.P. must have an adequate knowledge of the powerful antibiotic agents at his disposal. He must know how best to choose from the wide range of sedatives and analgesics. He must know which drugs are of value and which are a hang-over from a less fortunate age when it was necessary to send up a great barrage of treatment in the hope that something would hit the invading disease. He must wait and watch the new drugs, such as the methonium compounds, until he is assured how best to make use of them. More extensive knowledge of pharmacology is needed now than twenty years ago because of the power and variety of the very real remedies in our hands.

Thirdly, he must, as always, understand the minds of men and women. The psychological background of dyspepsia, asthma, and the various nervous syndromes must be studied. The patients with a nervous element clouding and clogging their mild organic cardiovascular disease have to be lived with year after year, and the problem of the practitioner is the prolonged one of obtaining maximum activity compatible with safety from individuals whose

instinctive mechanism for self-preservation has become useless. He must study the underlying neurosis of those unfortunates who suffer from allergic skin conditions and the background and psyche of the child with asthma.

Fourthly, he must acquire the special skill needed to do his surgeries. There is the constant need for "sorting," to assure the best distribution of time. He must know who has to be examined and who not examined. He must learn to spot the probable intussusception among a number of loudly proclaiming babies. He must not miss the elderly dyspeptic who has underlying coronary disease.

Lastly, he must learn how to educate his patients. How slowly proceeds the teaching of men and women of all sorts that a bottle of tonic is of no use to them, that good health comes with proper attention to rest, exercise, peace of mind, and purposive activity. Who does not experience the case of the man who receives twenty minutes of our time devoted to explanations and advice, but who has no medicine—only to come again two days later asking once more for "just a bottle of good strong tonic"? The G.P. must be like Chaucer's clerk—"Gladly would he learn and gladly teach."

Of the other activities that need a variety of skill and patience—the giving of adequate gas and oxygen or safe ethyl chloride for dental cases, of the patient, hopeless helping of the incurable, of the opportunities to observe and add one's own small contribution to medical knowledge—there is no space to write. May I plead, though, that here is work for the best that our medical schools can turn out?

General practice is not a specialty. Such nomenclature is a contradiction in terms. It is simply the general practice of medicine. May the time soon come when it is recognized for what it is—work harder than that of the consultant, more exacting than that of the pathologist, but with scope enough to satisfy the most ambitious members of our profession.—I am, etc.,

Midsomer Norton, Somerset.

K. E. LANE.

Something Wrong

SIR,—After a few months' enjoyable and interesting work as a salaried assistant in general practice, from which I intend shortly to return to my specialty, may I express my surprise that the community should place such confidence in the integrity of any of its members—even doctors?

Perhaps it is not generally realized that a general practitioner is paid more per unit of work the less he does. The former safeguards of prestige and prosperity awaiting sound work having been abolished, the health of the nation now depends solely on the family doctor's conscience and love of his work. Dependable though these are, I feel that it would be in the public interest if the doctor was rewarded, in the natural human way, for services rendered.

What about a system of recording all primary surgery attendances and visits in each illness, with a statistically calculated bonus for above-average numbers? This, with an increased capitation fee for certain categories of patients, would enable the popular hard-working practitioner to receive a just reward for his labours. It would also cover the anomaly of the practitioners whose patients are hit by an epidemic when his neighbours are not. Perhaps then there would be fewer apologetic calls to adults with board-like abdomens and children with rigid spines.

The public has already an uneasy feeling that something is wrong, which even in my small experience prevents many from "troubling the doctor," sometimes until too late.—I am, etc.,

London, S.E.27.

MARY ELLIOTT.

Notice of Retirement

SIR,—When a G.P. retires from the N.H.S. his patients receive notification on the first day of the quarter following his resignation, informing them that Dr. X has agreed to accept them, but if they wish to choose a different doctor they have a fortnight in which to do so. With this arrangement, if Dr. A or B takes any of these patients, Dr. X gets the payment for that quarter, as it has already started before

the patients get a chance to change. One might think this such a rare occurrence as not to matter, but since the N.H.S. started four G.P.s in this neighbourhood have resigned, and it is the same story each time.

I suggest that, as executive councils have three months' notice of a G.P.'s retirement, they could easily notify the retiring doctor's patients a fortnight before the end of the quarter, to enable them to get on the list of their new doctor by the time the next quarter starts.

With regard to the purging of lists; I find that most of the people who are noted as "untraceable" have lived for years at the address given and are still there, and others have changed their address in the same district; in both cases no very strenuous efforts can have been made to trace them.

On the obverse side, nearly every week someone comes for treatment who has no medical record envelope, though he joined the list long since, often with a Forces' release form. Sometimes, on writing up, the M.R.E.s are forthcoming, and sometimes the patients have to rejoin on E.C.1s, and I suffer the loss of capitation fee.

It is probably worth every G.P.'s while to get an official list of his patients, even at a small fee for the work involved. —I am, etc.

London, N.8.

E. J. RUBRA.

Sale of Goodwill

SIR,—Dr. Murray Bladon (*Supplement*, February 9, p. 54) should be thanked for raising at an opportune moment a fundamental issue. Some time before the appointed day I heard the present chairman of the General Medical Services Committee say that the goodwill clauses must be opposed because we ran a chance of being paid in a depreciated currency. At least in that he was right. The present time is opportune because an economizing Government might save £66m. and general practitioners might receive an enhanced money value for their practices.

I have been impressed by the number of our difficulties which arise from the loss of the right to sell our goodwill. The efforts to correct the difficulties and anomalies of present conditions, such as the Working Party, lead to one end only—a State-salaried medical service. This appears to be a fairly universal view, but equally universally there is a fatalistic belief that it is impossible to reverse present conditions. I will try to outline how a reversal might be made.

The old National Health Insurance right of any registered medical practitioner to have his name placed on any medical list should be re-established. This would mean the abolition of that egregious body the Medical Practices Committee—unregretted and a small contribution to economy. With a uniform capitation fee, distribution of doctors can be left to look after itself. Simultaneously the right to buy and sell practices should be restored.

There would at this time be two kinds of practices, those whose owners were entitled to compensation and the ones whose owners were not. If the owner of a compensatable practice decided to forgo his right to compensation, he would become entitled to sell his practice. He would require a fairly long period to exercise his option, however, because he could not fairly be expected to do so until a market had been created, and I suggest that the option should remain open from one to two years. The practices whose owners were not entitled to compensation, or whose owners, of compensatable practices, had elected to take compensation, would be saleable by the Government when they became vacant. Once a market had been established, some of the unentitled practitioners might want to buy the full rights in them from the Government, and machinery could be set up for that purpose, though it appears obvious that the purchase price in these cases would have to be appropriate to the date of entry into the practice and not to the date of purchase.

The greatest difficulty would be the adjustments in respect of interest paid on compensation, when a doctor decided to forgo his compensation. The interest, while he got it, was derisory in amount, and he certainly has a counter-claim arising from the fact that his right to dispose of his asset

had, for a time, been restricted, and that some of his colleagues who could claim hardship were preferentially treated by receiving part or all of their capital. Some exceptional method will have to be devised for this problem, and I make no apology for suggesting that we should repay the net interest payments received, but be allowed to charge them as an allowable expense against our practices.—I am, etc.,

Wolverhampton.

ROBT. S. V. MARSHALL.

Rules for Patients

SIR,—Dr. D. Kennedy's night call (*Supplement*, February 9, p. 56) prompts me to place on record the following urgent afternoon call. The message received by my maid was, "Come quickly, Mrs. X is very ill." I went immediately, only to have the door opened by a puzzled Mrs. X, who knew nothing of the call and who surprisingly enough didn't even ask me for anything "as I was there." I learnt later that the call originated from Mrs. X's sister-in-law, who had been rather upset when Mrs. X had used the excuse of a severe headache to break an appointment she had had with her sister-in-law.

In retrospect, like Dr. Kennedy, I find these incidents amusing, but in reality they are, to say the least, an impertinence. What I am really interested in is the action, if any, being taken by the B.M.A. to have legislation introduced to punish people who abuse the Health Service in such a manner. I remember reading (*Supplement*, December 22, 1951, p. 277) that such rules had been recommended by the Association. What has happened to them? Will they ever be made law?—I am, etc.,

Hayes, Middlesex.

S. EDELMAN.

Binding Decision

SIR,—Is it a fact that our negotiators agreed that we (the doctors) would abide by the decision of the inquiry regarding our pay, but no similar binding decision was undertaken by the Minister of Health? If not, what is to prevent any award we may get being cut by half or even not being awarded anything at all?—I am, etc.,

West Kirby, Cheshire.

E. S. A. ASHE.

* * * The Secretary of the Association writes: The Minister of Health and the Secretary of State for Scotland have agreed to treat the award of the adjudicator as binding, subject to the overriding authority of Parliament and to a satisfactory distribution scheme being agreed by the parties. These terms were approved by the Conference of Local Medical Committees.

POINTS FROM LETTERS

Paying for the Health Service

Dr. HUGH W. FORSHAW (Liverpool) writes: With reference to the letter from Mr. Hilary C. Marquand (*Journal*, February 2, p. 272). . . . It was abundantly clear that any man who had been paying a weekly stamp for health insurance for 20 years would naturally presume that the said stamp on and after July 5, 1948, would be devoted to the same purpose. I venture to suggest that the "misunderstanding" was deliberately fostered by the Government then in power for very obvious reasons. Millions of pounds were spent annually by the Ministry of Information, but not one penny was spent in making this fact clear. It was left to the doctors themselves to instruct their own Public Relations Department to produce a leaflet at the doctors' expense explaining to the public how little of the weekly stamp was devoted to the Health Service. . . .

Allaying Anxiety

Dr. L. P. DAVIES (Harrow, Middlesex) writes: It is comforting to gather from the survey of Professor Dunlop and others (*Journal*, February 9, p. 292) that the free Health Service would not be wrecked if the charge for prescriptions made them unpopular. An idea has sprung up that, if a consultation (no charge) ends without a recommendation for a drug, an appliance, or a priority, the time has been wasted. One of our most important jobs in practice is to allay anxiety, and this requires no pricing bureau.

H.M. Forces Appointments**ROYAL NAVY**

SUTTON COLDFIELD DIVISION.—At Sutton Coldfield Hospital, Thursday, March 20, 9.15 p.m., annual general meeting.

Meetings of Branches and Divisions**NORTH WALES BRANCH**

A meeting of the Branch took place at St. Asaph on October 11, 1951, under the presidency of Dr. J. G. MacQueen. The main business was a B.M.A. lecture on "Maternal Obesity" by Dr. J. H. Sheldon, physician to the Royal Hospital, Wolverhampton. There were 36 members present, and the lecture was enthusiastically received.

With the aid of lantern slides Dr. Sheldon described his researches. The most striking feature in his series of 100 cases, he said, was that weight tended to be put on rapidly over a short space of time and then slowed up markedly. Some gained during pregnancy and increased with each pregnancy. Others increased only after the pregnancy, and in others the gain might take place with one pregnancy only. In another rare type the patient might lose weight rapidly after the conclusion of a pregnancy.

There were two clinical types—one where the fat distribution was mainly on the trunk and the other where the buttocks and legs took the brunt of it. The women usually had large babies, with an increase in neonatal mortality. The women themselves were normal in vigour, blood pressure, menses, and lactation, but as a class were much more liable to develop diabetes. There might well be a hereditary factor, in that most had fat mothers and might have started life as fat babies.

Dr. Sheldon then discussed the aetiology of this condition. Citing experiments on the hypothalamus of rats, he thought some kind of stimulation of the human thalamus was the cause of the weight gain. Cortisone and A.C.T.H., by causing the adrenals to stimulate the hypothalamus, could give rise to staggering gains in weight. It was well known that instability of the steroid levels occurred in pregnancy, as evidenced by the formation of striae both in some pregnancies and after cortisone administration. He thought psychological factors operated in some cases too, and cited an instance of five successive girl babies without any change in the maternal weight, followed by a male child immediately associated with an enormous gain in weight.

As regards treatment, he had not had any success with endocrine preparations. Amphetamine was useful in reducing appetite. As many of these obese women could maintain weight on a low diet, the caloric intake had to be usually below 1,000 daily before the weight was lost. It was difficult to secure co-operation from the patients, and most of them, after losing weight, left off the diet and were soon back where they were before.

In the discussion which followed, Dr. Trevor Hughes suggested the use of chewing-gum. Dr. Sheldon replied that these women were not satisfied unless they felt something going down.

Are Vaginal Tampons Prejudicial to Health?

An Investigation* concerned with the bacteriology of vaginal flora following the use of internal tampons was undertaken at the request and with the co-operation of the visiting gynaecologists to a London Women's hospital.

It is gratifying to find that this investigation confirms earlier work carried out in America and gives further support to the claim that Tampax can be confidently recommended as a convenient, comfortable and safe form of sanitary protection.

* Tampax tampons were used in this investigation.

EXTRACTS FROM THE REPORT:—

- ★ "Smears and cultures taken before and after each period showed no appreciable change in the bacterial flora of the vagina."
- ★ "None of the volunteers acquired monilia or trichomonal² organisms during the period of study or developed erosions or vaginitis as a result of using the internal tampon."
- ★ "There was no aggravation of the condition or delay in healing following the use of tampons in the patients who had cervical erosions."
- ★ "In each case the underlying cause responded to treatment, and did not recur, which proves that the internal tampon does not act as an irritating foreign body."
- ★ "The rate of healing compared favourably with four control cases in which the perineal pad was used."
- ★ "The glycogen content was uninfluenced by the use of tampons."
- ★ "There was no appreciable alteration in the pH in the pre- and post-menstrual phases."
- ★ "Volunteers who had not previously used tampons stated that they did not cause the irritation usually found with the perineal pad."
- ★ "There was no evidence that vaginal tampons are prejudicial to health."

British Medical Journal, 1, 24 (1952)

Literature and professional samples of Tampax will be sent on request to:

A new development in Weaning Food

NEW - SAFE
scientifically tested

As a result of experiment, the Makers of Bovril have evolved a thoroughly hygienic product that reaches a high nutritional standard, is easy to prepare and is remarkably inexpensive. The formula was evolved after consultation with several paediatric specialists and has had successful hospital trials. The Weaning Food is in powder form and is marketed in small cubes in four varieties. It is composed of powdered lean beef, beef extract, potato powder, dried distillers' yeast, bone calcium phosphate and iron ammonium citrate. A purée can be prepared by adding boiling water to a crumbled cube of the Weaning Food. Because of its form, its hygienic method of manufacture, and as sufficient for one meal at a time can be prepared, danger of food infection is eliminated. A four-cube packet of Weaning Food costs 6d.; a meal for a 4-month-old baby costs only ½d.

4 CUBE PACKET

4 varieties

BEEF & MIXED VEGETABLES
BEEF & TOMATO
BEEF & SPRING CABBAGE
BEEF & CARROT

Each flavour is in different coloured foil wrapper.

BOVRIL BRAND Triturated Beef and Vegetable

Weaning Food

for infants of 4 months to 2 years of age.

The facts about Glucose

Glucose, a term used to include a substance resulting from the partial hydrolysis of starch, is in practice a general description rather than a precise one. It is applied to medical preparations which contain additives that may not always be wanted and to commercial products of varying degrees of refinement. To identify Glucose in its purest form, *and only in this form*, the term Dextrose is used.

Dextrose, as found in the blood and tissues, is the sugar into which the body converts all carbohydrates. Requiring neither digestion nor chemical alteration, Dextrose is used by the body as a source of immediate energy.

The Dextrose (pure medicinal Glucose) produced by the Pharmaceutical Division of Corn Products Company Limited is prepared in two convenient forms:—

Dextrosol Powdered Glucose

This contains no additives of any kind. It can be taken in large quantities without causing nausea, and should be prescribed in all cases where a patient needs a source of heat and energy with the least demand on the digestion. Packed in 1 lb. & ½ lb. cartons.

Dextrosol Karo Glucose Syrup

for Infants and Children

An appetising blend of pure Glucose and selected carbohydrates, carefully balanced to provide the ideal sugar addition to the milk diet of artificially-fed infants. Of special value in cases of nutritional disorder. Spread on rusks, bread, etc., it offers an excellent supplementary source of energy for growing children. Packed in 1 lb. tins. A Karo Baby Book is available for the guidance of mothers.

Professional samples of both Dextrosol products will be gladly provided. For further information, doctors are invited to write to the Dextrosol Information Bureau, Wellington House, 125/130 Strand, London, W.C.2.

APPOINTMENTS

Applicants should state name, address, age, nationality, qualifications, and enclose 3 copies (unless otherwise specified) of recent★ testimonials with short statement of experience and appointments held.

Applications should be sent at once if no closing date is given.

Canvassing in any form will disqualify.

★SERVICE MEMBERS may have difficulty in supplying recent testimonials, but this should not deter them from applying.

Deferment of call-up for "R" practitioners (i.e., practitioners liable for call-up under the National Service Acts) is granted at the discretion of the Central Medical War Committee and (in Scotland) the Scottish Central Medical War Committee. The Committees normally allow an "R" practitioner to hold a First House Officer post (N.H.S. salary £350 per annum) provided that he obtains it without delay. Under present arrangements the Committees also normally allow an "R" practitioner to hold a Second House Officer post (£400) and a Senior House Officer post (£670), provided in each case that the higher appointment is secured before the termination of the practitioner's current appointment.

"R" practitioners may not accept Third House Officer posts (£450 per annum) unless they have obtained the special permission of the C.M.W.C. or (in Scotland) the Scottish C.M.W.C.

SALARY SCALES OF JUNIOR GRADES OF HOSPITAL MEDICAL STAFF

Registrar Grades, Whole-time

(a) **REGISTRAR**: Posts obtained normally not less than two years after registration as a medical or dental practitioner and held normally for two years: £775 per annum in the first year; £890 per annum in the second and any subsequent years.

(b) **SENIOR REGISTRAR**: Posts obtained normally not less than four years after registration as a medical or dental practitioner and held normally for three years: £1,000 per annum in the first year; £1,100 per annum in the second year; £1,200 per annum in the third year; £1,300 per annum in any subsequent years.

Other Grades, Whole-time

(a) **HOUSE OFFICER**: £350 per annum for the first post held, £400 per annum for the second post held; £450 per annum for the third and any subsequent post held; with, in each case, a deduction at the rate of £100 per annum in respect of board and lodging and other services provided. Each post shall be tenable for six months.

The Minister will be prepared to authorize, in exceptional circumstances, salaries up to £50 per annum higher than the standard rates specified above where a post cannot be filled otherwise.

(b) **SENIOR HOUSE OFFICER**: Posts obtained normally not less than one year (in Scotland, two years) after registration as a medical or dental practitioner and normally held for one year only: £670 per annum.

(c) **JUNIOR HOSPITAL MEDICAL OFFICER**: Officers who have held house appointments but who are not Registrars and who have less responsibility than other hospital officers of non-consultant status: £700 (for an officer appointed not less than two years after registration as a medical practitioner) by £50 to £1,000 per annum.

ALL NATIONAL HEALTH SERVICE HOSPITAL APPOINTMENTS ARE IN ACCORDANCE WITH THE TERMS AND CONDITIONS OF SERVICE OF HOSPITAL MEDICAL STAFF

Those intending to apply for resident appointments in the Registrar grades are recommended to make inquiries with regard to the deductions proposed for board and lodging at the time of submitting their applications, where this is not stated in the advertisement.

NEWCASTLE REGIONAL HOSPITAL BOARD

Regional Chest Surgery Centre (160 beds), Shotley Bridge Hospital, and associated Sanatoria

WHOLE-TIME ANAESTHETIST (Senior Registrar)

Locum tenens appointment, tenable up to August 31, 1952. It is possible that a longer term senior registrar post will be available after August 31, but this will be subject to open competition again. The great bulk of the work in the main centre, i.e., excluding the sanatoria, is concerned with non-tuberculous conditions (mediastinal, oesophageal, cardio-vascular as well as pulmonary). Candidates must possess a D.A., have had considerable experience with anaesthesia, and preferably have had a sound preliminary general medical, and/or physiological training. Appointee must be prepared to take an active part in clinical and physiological investigations, pre-operative and post-operative management of patients in addition to undertaking the customary duties of an anaesthetist. The allocation of these duties may have to be varied from time to time according to clinical requirements by arrangement with the Senior Anaesthetist, but usually the work will be divided between the centre and the sanatoria. Appointment subject to National Health Service (Superannuation) Regulations, 1950. Applications, giving details of qualifications and experience, together with copies of one to three testimonials, and/or the names and addresses of one to three referees, should be sent to the Senior Administrative Medical Officer, Newcastle Regional Hospital Board, Blythwood South, Osborne Road, Newcastle, 2, within fourteen days. Candidates are entitled to visit the hospitals by arrangement with the Senior Surgeon, Regional Chest Surgery Centre, Shotley Bridge Hosp. (9344)

DONCASTER ROYAL INFIRMARY

(Recognized under the regulations for the D.A.)
Doncaster Hospital Management Committee Applications are invited from registered medical practitioners with the necessary experience for the appointment of

ASSISTANT PSYCHIATRIST
A house on the hospital estate is available for the successful candidate. Salary scale £1,300 to £1,750 per annum. Application forms and further details may be obtained from the Senior Administrative Medical Officer, Sheffield Regional Hospital Board, Fulwood House, Old Fulwood Road, Sheffield, 10. Completed forms should be returned to the Secretary not later than April 12, 1952. (9395)

SHEFFIELD REGIONAL HOSPITAL BOARD

Applications are invited from registered medical practitioners, preferably holding a higher qualification in psychiatry, for the whole-time post of

ASSISTANT PSYCHIATRIST
who will be attached to the Middlewood Hospital, Sheffield (1,788 beds). A house is available for the successful candidate. Salary scale £1,300 to £1,750 per annum. Application forms and further details may be obtained from the Senior Administrative Medical Officer, Sheffield Regional Hospital Board, Fulwood House, Old Fulwood Road, Sheffield, 10, and returned to the Secretary not later than April 12, 1952. (9396)

FRIERN HOSPITAL, New Southgate, N.11 (2,470 beds)**North-West Metropolitan Regional Hospital Board**

PSYCHIATRIC REGISTRAR
Required for one year. Candidates should have adequate general medical and psychiatric experience and may be required to be seconded to St. Pancras Hospital for duty in the observation wards. Candidates may visit the hospital by direct arrangement with the Physician Superintendent. Application forms obtainable from, and returnable to, the Secretary, Friern Hospital Management Committee, Friern Hospital, New Southgate, N.11, within ten days of the appearance of this advertisement. (9603)

NATIONAL HOSPITALS FOR NERVOUS DISEASES

Applications are invited for the appointment of

WHOLE-TIME PSYCHOLOGIST
at the National Hospital, Queen Square, W.C.1. A medical qualification would be an advantage. Experience in psychometric methods and research interests will be recommended. If the successful applicant is medically qualified the post will carry the grade of Registrar. The appointment will be for one year in the first instance. Applications, giving the names of two referees, should be sent to the undersigned not later than March 26, 1952. H. Ewart Mitchell, Secretary, The National Hospitals for Nervous Diseases, Queen Square, W.C.1. (9454)

BRISTOL, UNITED, HOSPITALS BOARD OF GOVERNORS AND SOUTH-WESTERN REGIONAL HOSPITAL BOARD

Applications are invited by the above Boards from registered medical practitioners for the joint appointments of

REGISTRARS IN PSYCHIATRY to the South-Western Region

The successful candidates will be based on the Bristol Mental Hospitals Group (Barrow and Fishponds Hospitals, and the Bristol Neurosis Centre). The appointments, which may be resident or non-resident, will be held for one year in the first instance, when the contracts will be reviewed and the Registrars may then be posted to a mental hospital elsewhere in the Region. It is intended that the posts will offer training to enable holders to obtain the Bristol D.P.M. Holders will, therefore, be required to gain experience in child psychiatry, mental deficiency and neurology, as well as the general and special branches of adult psychiatry, and their work will be arranged accordingly. They will also be able to attend the course for Part I and Part II D.P.M. at the University of Bristol. The posts also offer excellent opportunities for special postgraduate experience in psychiatry, and for research work for the preparation of a thesis for higher qualifications. There are well-equipped departments of electroencephalography, experimental and applied psychology, and biochemical and endocrinological research, and an extensive psychiatric library at Barrow Hospital. Twelve copies of applications, stating date of birth, qualifications, and experience, together with twelve copies of two testimonials, and the names and addresses of two referees, should be sent to the Secretary of the Regional Hospital Board, 5, Corham Lawn Road, Bristol, 6, not later than March 31, 1952. (9432)

CHERTSEY, SURREY, BOTLEYS PARK HOSPITAL**South-West Metropolitan Regional Hospital Board REGISTRAR (Psychiatry)**

Suitable post for D.P.M. candidate requiring qualification in mental deficiency practice and preparing for the examination. The hospital provides full facilities for 1,600 defectives of all grades and is recognized as a teaching centre for the D.P.M. Accommodation available for single person. National Health Service appointment in accordance with the terms and conditions of service of hospital medical staff. Application forms obtainable from the Secretary of the Hospital Management Committee, which, when completed, should be returned within fourteen days of the appearance of this advertisement. (9328)

CHICHESTER, SUSSEX, GRAYLINGWELL HOSPITAL MANAGEMENT COMMITTEE**South-West Metropolitan Regional Hospital Board**

Applications are invited from ladies and gentlemen for the appointment of

TWO WHOLE-TIME REGISTRARS
at the above Psychiatric Hospital, which contains 1,100 beds and admits approximately 900 patients per annum of whom 80 per cent are voluntary. There are three active out-patient clinics. All modern treatments—both physical and psychotherapeutic—are practised. Full facilities are available for psychological and physical investigation. There are departments of neurology and of clinical research. In preparation for the D.P.M., courses of lectures and clinical demonstrations in adult psychiatry are given regularly by the Director of Clinical Research and senior members of the staff. The hospital is approved by the Conjoint Board of Examiners for training in neurology for the D.P.M. The appointments will be subject to the terms and conditions of service for medical and dental staff and also to the National Health Service (Superannuation) Regulations. Canvassing will disqualify, but candidates may visit the hospital by arrangement with the Medical Superintendent. Furnished accommodation is available for a single officer. Application forms, for which a stamped addressed envelope should be supplied, may be obtained from the Group Secretary, Graylingwell Hospital, Chichester, and five copies should be returned to him, duly completed, not later than fourteen days after the appearance of this advertisement. (9604)

LEEDS REGIONAL HOSPITAL BOARD

Applications are invited for the post of

REGISTRAR in Psychiatry
for duties at the Oulton Hall Hospital, near Wakefield, and affiliated Mental Deficiency Colonies. The post is non-resident. It is anticipated that the successful candidate will have the opportunity for training in child psychiatry in association with the department of psychiatry of the University of Leeds, which he will attend on two sessions per week. Applications, stating age, qualifications and details of present and previous appointments (with dates), together with the names of three referees, should be forwarded to the Secretary, Joint Registrars Committee, Park Parade, Harrogate not later than March 29, 1952. (9398)

LEEDS, ST. JAMES'S HOSPITAL, Leeds Regional Hospital Board

Applications are invited for the appointment of **REGISTRAR in Psychiatry**. The post will be resident for which the appropriate charges will be made. The psychiatric unit of this general hospital deals with emergency admissions

from the City of Leeds and has accommodation for investigation and treatment of patients suffering from neurosis. There is also a large out-patient department. Facilities will be available for study for the D.P.M. in association with the department of psychiatry at Leeds University. Applications, stating age, qualifications and details of present and previous appointments (with dates), together with the names of three referees, should be forwarded to the Secretary, Joint Registrars Committee, Park Parade, Harrogate, not later than March 29, 1952. (9397)

MANCHESTER REGIONAL HOSPITAL BOARD

Applications are invited for the post of **SENIOR REGISTRAR IN PSYCHIATRY** with main duties at Prestwich Hospital (2,800 beds) near Manchester. The person appointed will also be required to attend psychiatric clinics and take part in the treatment of in-patients at general hospitals at Oldham and Rochdale. Residential accommodation for a single person is available at the hospital. Alternatively, the post may be on a non-resident basis. Previous experience in psychiatry, and a higher qualification, is essential. Forms of application may be obtained from the Senior Administrative Medical Officer, Manchester Regional Hospital Board, Cheetham Road, Manchester, 8, and should be returned, with the names of three referees, to be received by March 31, 1952. (9221)

SOUTH WARWICKSHIRE GROUP, Birmingham Regional Hospital Board

Applications are invited for the appointment of

SENIOR PSYCHIATRIC REGISTRAR
Duties at Central Mental Hospital, near Warwick (1,423 beds) including neurosis unit and clinics for adults and children. Candidates should possess D.P.M. (Postgraduate instruction available). Accommodation available for married or single applicant. Appointment subject to National Health Service (Superannuation) Regulations. Ten copies of applications, stating name, age, nationality, qualifications, present and previous appointments, details of three referees, to Secretary, 10, Augustus Road, Birmingham, 15, before March 31, 1952. Candidates may visit the hospital. (9605)

WILLERBY, HULL, DE LA POLE HOSPITAL, Leeds Regional Hospital Board

Applications are invited for the appointment of

SENIOR REGISTRAR in Psychiatry
The appointment will be resident for which the necessary deductions from salary will be made. Candidates must hold the D.P.M. or equivalent qualification. It is anticipated that the successful candidate will undertake two clinical sessions in association with the department of psychiatry of the University of Leeds. Applications, stating age, qualifications and details of present and previous appointments (with dates), together with the names of three referees, should be forwarded to the Secretary, Joint Registrars Committee, Park Parade, Harrogate, not later than March 29, 1952. (9399)

WOODFORD GREEN, ESSEX, CLAYBURY MENTAL HOSPITAL, Woodford Bridge

REGISTRAR IN PSYCHIATRY (Resident or Non-resident)

The appointment is subject to review after one year. A local charge would be made for any meals or residential amenities provided. Applications, in duplicate, stating date of birth, full details of qualifications and experience, present appointment, grade and salary, together with two copies of two recent testimonials, should reach C. E. Nicol, Secretary, North-East Metropolitan Regional Hospital Board, 11a, Portland Place London, W.1, by Saturday, March 29, 1952. (9433)

FOUNTAIN GROUP HOSPITAL MANAGEMENT COMMITTEE**JUNIOR HOSPITAL MEDICAL OFFICER (National Health Service Salary Scale)**

Applications are invited from registered medical practitioners (male or female, resident or non-resident) for the above appointment. The Fountain Group caters for 630 mentally defective children, 80 adult female defectives, and 50 blind children, and provides wide experience in neurology, paediatrics, and child psychology, as well as in mental deficiency. There are clinical and neuropathological research units, and clinical conferences are held weekly. Numerous lectures and demonstrations are given to students and graduates. Applications, giving full particulars and three referees, to Secretary, Fountain Hospital, Tooting Grove, London, S.W.17. (9561)

Applications are invited for the following resident appointments at the above mental hospital (1,200 beds, with separate unit for private patients):

JUNIOR HOSPITAL MEDICAL OFFICERS
SENIOR HOUSE OFFICERS

Mental hospital experience not essential. Excellent opportunities for studying, and experience of modern methods of psychiatric treatment, including Out-patient Clinics. Applications, stating age, qualifications, and details of appointments, with copies of three testimonials, to be sent to the Medical Superintendent as soon as possible. (9562)

WILLERBY, E. YORKSHIRE, DE LA POLE HOSPITAL (1,174 beds)

WHOLE-TIME JUNIOR HOSPITAL MEDICAL OFFICER
Most modern methods of treatment practised. Residence for single person only. Application forms from Secretary, Hull (B) Group H.M.C., De la Pole Hospital. (9356)

AYR, GLENGALL MENTAL HOSPITAL
Board of Management for Ayrshire Mental Hospitals

Applications are invited from qualified medical practitioners (male or female) for the post of **SENIOR HOUSE OFFICER**. Salary £670 per annum in terms and conditions of service under National Health Service. Applications, in writing stating age and experience, to be submitted to Medical Superintendent, Glengall Mental Hospital, Ayr, accompanied by two copies of testimonials. (9563)

BEVERLEY, YORKS, BROADGATE HOSPITAL
(600 Mental beds)**RESIDENT SENIOR HOUSE PHYSICIAN**

Salary £670 per annum.

RESIDENT HOUSE PHYSICIAN

Salary £350 to £450, according to previous posts held.

Applications to Secretary, Westwood Hospital, Beverley, Yorks. (9359)

BRENTWOOD MENTAL HOSPITAL
Brentwood, Essex**SENIOR HOUSE OFFICER**

Required at once. The hospital has over 2,000 beds and an annual admission rate of over 600 patients. All modern treatments are carried out and the post affords a means of gaining valuable experience in modern psychiatry. Instruction will be given by Senior Staff. Salary is at the rate of £670 per annum, less £150 for residential amenities. Applications, stating age, experience and qualifications to the Physician Superintendent, with names of two referees, as soon as possible. (9505)

CAMBRIDGE, FULBOURN HOSPITAL

Applications are invited for the appointment of **SENIOR HOUSE OFFICER**

at the above hospital. This hospital (which is linked with the University and its teaching hospital) is progressive, and has a large annual admission rate, mainly of voluntary patients. All forms of modern treatment are given. There are four associated out-patient clinics. Facilities exist for D.P.M. Applications, with names of two referees, should be sent to the Medical Superintendent immediately. (9338)

SHEFFIELD NO. 1 HOSPITAL MANAGEMENT COMMITTEE

(Recognized for the D.P.M. examination)

Applications are invited from suitably qualified practitioners for the resident post of

SENIOR HOUSE OFFICER (Psychiatry)

for duties at the City General Hospital and the adjoining Fir Vale Infirmary. Applicants should, preferably, have held general hospital posts, but psychiatric experience is not essential. The successful candidate will form part of a team consisting of a consultant psychiatrist, consultant psychologist, and an assistant psychiatrist within the setting of a large modern general hospital. The duties will form an introduction to the investigation and treatment of the psycho-neuroses, psychosomatic disorders and acute psychoses. Apply, giving full details of age, qualifications, present and previous appointments (with dates) and the names of two persons to whom reference may be made, to the undersigned at Nether Edge Hospital, Sheffield, 11.—W. Stansfield, Secretary. (9057)

WICKFORD (near), ESSEX, RUNWELL MENTAL HOSPITAL

Applications are invited for the appointment of **JUNIOR HOUSE OFFICER (Male or female)**
(Third post)

to work in one of the Consultant's Divisions. The person appointed may also be required to assist in out-patient work. There are excellent facilities for postgraduate work for the D.P.M. Salary at the rate of £450 per annum, less £100 for residential emoluments. Applications, stating age, etc., together with copies of testimonials, should be sent to the Secretary as soon as possible.—T. Fitzroy Kelly, Secretary. (9506)

RADIOLOGY**NORTHERN IRELAND HOSPITALS AUTHORITY**

The Authority invite applications for three posts as

CONSULTANT RADIOLOGIST

The posts are: (1) The South Down and South Armagh Groups of hospitals, comprising five hospitals with a combined total of 504 beds. (2) The North Antrim and Coleraine and Portrush Groups of hospitals, comprising seven hospitals, with a combined total of 442 beds. (3) Seven hospitals in the area Mid-Ulster, Mid-Antrim and East Antrim, with a combined total of 849 beds. The terms and conditions of the appointment will be in accordance with the Authority's application to Northern Ireland of the Spens Report. Applications should be made on a form which may be obtained, together with further details, from the Secretary, Northern Ireland Hospitals Authority, Friends' Provident Building, 58, Howard Street, Belfast, which must be returned as to be received by him not later than March 29. (9607)

PUBLIC HEALTH

(See Important Notice page 23)

BIRMINGHAM, CITY OF, EDUCATION COMMITTEE

School Health Service
Applications are invited for the appointment of **ASSISTANT SCHOOL MEDICAL OFFICER** in the School Health Service. Candidates must have had at least three years' experience in the practice of their profession subsequent to obtaining a registrable qualification. Salary £850 by annual increments of £50 to £1,150 per annum. Previous experience in Local Government Service may be taken into account. Travelling expenses allowed. Forms of application (to be returned not later than Monday, March 31), together with further information, obtainable from the undersigned on receipt of a stamped, addressed foolscap envelope. Communications should be endorsed "Assistant School Medical Officer." Canvassing will disqualify.—E. L. Russell, Chief Education Officer, Education Office, 74-75, Broad Street, Birmingham, 15. (9102)

BIRMINGHAM, CITY OF Health Department**ASSISTANT ADMINISTRATIVE MEDICAL OFFICER (M. and C.W.)**

Duties include work in connexion with Children's Department. Experience essential with mothers and children, including six months' resident post in maternity and children's hospitals. D.P.H. or D.C.H. and any administrative experience additional qualification. Salary £1,050 by £50 to £1,250, according to qualifications and experience. Pension scheme (including widows and orphans); medical examination. Form obtainable from undersigned. Applications, with three testimonials, to be returned by March 31, 1952.—Medical Officer of Health, Council House, Birmingham, 3. (9620)

BURTON-UPON-TRENT, COUNTY BOROUGH OF

Applications are invited from registered medical practitioners for the post of

ASSISTANT MEDICAL OFFICER OF HEALTH AND ASSISTANT SCHOOL MEDICAL OFFICER

Preference will be given to candidates possessing the D.P.H. or D.C.H. The duties will consist of work mainly in connexion with maternity and child welfare and school medical inspection, but will also include such other public health work (e.g., health education) as the Medical Officer of Health may direct. Salary will be within the scale £850 per annum, rising by £50 annually to a maximum of £1,150 per annum, the point of entry to be fixed in accordance with the candidate's experience and qualifications. The appointment will be subject to the provisions of the Local Government Superannuation Act, 1937, to three months' notice on either side at any time and to the successful candidate passing a medical examination by the Medical Officer of Health. Forms of application may be obtained from the Medical Officer of Health, Town Hall, Burton-upon-Trent, and should be returned to me, with copies of not more than three recent testimonials, not later than March 31, 1952.—H. Bailey Chapman, Town Clerk, Town Hall, Burton-upon-Trent. (9383)

LANCASHIRE COUNTY COUNCIL ASSISTANT DIVISIONAL MEDICAL OFFICERS

Applications are invited from registered medical practitioners for above appointments. Possession of D.P.H. desirable. Salary £850 by £50 to £1,150 per annum. Travelling and subsistence allowances where applicable. Posts superannuable and subject to medical examination. Application forms and further particulars obtainable from County Medical Officer of Health, East Cliff County Offices, Preston, to whom they must be returned not later than Saturday, April 12, 1952. (9485)

LEICESTER, CITY OF**Education Committee SENIOR ASSISTANT SCHOOL MEDICAL OFFICER AND ASSISTANT MEDICAL OFFICER OF HEALTH**

Applications are invited for the above post from registered medical practitioners holding recognized qualifications in Public Health or State Medicine. The appointment is primarily that of Senior Assistant to the Senior Medical Officer (Education), but the duties, in addition to work in connection with the School Health Service, will include those of Assistant Medical Officer of Health. The officer appointed will work under the general control of the Medical Officer of Health, who is also School Medical Officer, and will be expected to carry out the above duties and such other duties as are assigned to him. Salary scale: £950 by £50 to £1,250 per annum. The commencing salary will be determined by reference to the applicant's previous experience. The appointment is subject to the provisions of the Local Government Superannuation Act, 1937, is terminable by three months' notice on either side, and the successful candidate will be required to pass a medical examination. Further details of the appointment may be obtained by reference to the undersigned, and applications, together with copies of three testimonials, should be returned to this office within fourteen days of the appearance of this advertisement.—Elfred Thomas, Director of Education, Newark Street, Leicester. (9384)

LANCASHIRE COUNTY COUNCIL DIVISIONAL MEDICAL OFFICER Health Division 2 (Lancaster)

Applicants must be medical practitioners holding the D.P.H. or equivalent qualification and with administrative experience. The Divisional Medical Officer will be required to act as Medical Officer of Health to the County Districts within the Division, where they so desire. Basic salary as Divisional Medical Officer is £1,300 by £50 to £1,700. This scale will be substantially increased if Divisional Medical Officer is appointed Medical Officer of Health to one or more County Districts. The appointment is superannuable and subject to passing a medical examination. Full particulars and application forms obtainable from the County Medical Officer, East Cliff County Offices, Preston, to be returned by March 24. (9486)

LINDSEY COUNTY COUNCIL Public Health Department

Applications are invited from registered medical practitioners with mental health qualifications and experience for the post of

SENIOR MEDICAL OFFICER In the Mental Health Services

Salary scale £1,250 per annum, rising by annual increments of £50 to £1,650 per annum. The person appointed will be required to provide a car for the use of which an allowance on the County Council's scale will be paid. Forms of application can be obtained from the undersigned, to whom they should be returned not later than March 29, 1952.—W. S. H. Campbell, County Medical Officer of Health, County Offices, Lincoln. (9484)

MIDDLESEX COUNTY COUNCIL County Health Department**DEPUTY AREA MEDICAL OFFICER**

Required initially in Area 2 (Friern Barnet, Potters Bar Southgate and Wood Green) for administrative and clinical duties mainly in connexion with National Health Service and Education Acts. Must be prepared, if required, to undertake also duties of Medical Officer of Health or Deputy of one or more of County Districts in area, in which case, salary would be amended in accordance with appropriate nationally negotiated scale. Degree or Diploma in State Medicine or Public Health and practical experience in public health administration essential. Whole-time, established. Subject to medical assessment and prescribed conditions. Salary £1,200 by £50 to £1,500 per annum inclusive. Applications, stating age, qualifications, experience, two referees, to Joint Area Medical Officer, Town Hall, Palmers Green, London, N.15, by April 5 (quoting K.548 B.M.J.). Canvassing disqualifies.—C. W. Radcliffe, Clerk of the County Council. (9499)

MONMOUTHSHIRE COUNTY COUNCIL**SENIOR MEDICAL OFFICER for Maternity and Child Welfare**

The Council invite applications from duly qualified medical practitioners for the above-named appointment. Applicants must hold the Diploma in Child Health or an equivalent higher medical qualification. The duties will consist of the supervision of the antenatal and child welfare clinics, together with the undertaking of clinical work under the direction of the County Medical Officer. Salary £1,250 per annum to £1,650 by increments of £50 per annum. The successful candidate will be required to act under the direct supervision of the County Medical Officer, to devote whole time to the work of the County Council, and to reside in such place as the County Council may determine. The post will be subject to the provision of the National Health Service (Superannuation) Regulations and to a satisfactory medical examination. Conditions of appointment and a form of application can be obtained from the County Medical Officer, to whom applications, accompanied by copies of not more than three recent testimonials, are to be sent by March 23, 1952.—Vernon Lawrence, Clerk of the Council, The County Hall, Newport, Mon. (9515)

NOTTINGHAM, CITY OF Health Department

Applications are invited from qualified medical practitioners for the post of

ASSISTANT MEDICAL OFFICER OF HEALTH

The duties will be chiefly in connexion with maternity and child welfare, together with any other duties allocated by the Medical Officer of Health. Preference will be given to candidates possessing higher qualifications, and the salary attached to the appointment will be £850 by £50 to £1,150 per annum. The post will be subject to three months' notice on either side at any time. The successful candidate will be required to pass a medical examination under the provisions of the National Health Service (Superannuation) Regulations or the Local Government Superannuation Act, 1937. Conditions of appointment and forms of application may be obtained from the undersigned, to whom they must be returned, together with the names of two persons to whom reference may be made, not later than April 4, 1952.—T. J. Owen, Town Clerk, The Guildhall, Nottingham. (9342)

Public Health—contd.**NORWICH, CITY AND COUNTY OF
MEDICAL OFFICER OF HEALTH AND
SCHOOL MEDICAL OFFICER**

Applications are invited for the above whole-time appointment from medical practitioners possessing the appropriate qualifications and experience. The salary, calculated in accordance with Award 2285 of the Industrial Court, will be at the rate of £1,900 per annum, rising by annual increments of £50 to a maximum of £2,150 per annum, and, in addition, a car allowance will be paid. The appointment will be subject to three months' notice on either side and superannuable. The successful candidate will be required to pass a medical examination and to take up duty on or about October 21, 1952. Applications, stating age, full particulars of qualifications and experience, and accompanied by the names and addresses of three referees, should reach the undersigned not later than March 31, 1952.—Bernard D. Storey, Town Clerk, City Hall, Norwich. (8989)

**STAFFORDSHIRE COUNTY COUNCIL
ASSISTANT MEDICAL OFFICERS**

Applications are invited from fully qualified medical practitioners for the above-mentioned appointments, and those holding the Diploma of Public Health will be given preference. The candidates appointed will undertake clinical work in the School Health and Child Welfare Services under the direction of the County Medical Officer of Health, and will be required to perform such other duties as may from time to time be prescribed. The salary scale is £850 per annum rising by annual increments of £50 to a maximum of £1,150 per annum, and previous similar service may be taken into consideration when deciding the commencing rate. Each selected candidate may be required to provide a motor car, for which allowances will be paid in accordance with the County Council scale. A lodging allowance of 25s. per week, and return railway fare home every two months, will be paid for a maximum period of six months where the successful candidate is married and has to continue to maintain a home outside the geographical county while seeking housing accommodation. Each appointment will be terminable by one month's notice in writing on either side, and subject to the provisions of the appropriate Superannuation Acts and Regulations, in which connexion the selected candidates must pass a medical examination, and submit their birth certificates. Forms of application may be obtained from the undersigned, and should be returned to the County Medical Officer of Health, County Buildings, Stafford, not later than March 29, 1952, together with copies of not more than three recent testimonials.—T. H. Evans, Clerk of the County Council, County Buildings, Stafford (9244)

**WARRINGTON, COUNTY BOROUGH OF
ASSISTANT MEDICAL OFFICER OF HEALTH**

Applications are invited for the above appointment from registered medical practitioners. The duties will be directed by the Medical Officer of Health and will be mainly clinical, but will afford experience in the work of a Health Department of a Local Health Authority and in infectious diseases. The possession of a Diploma in Public Health would be an advantage. Salary £850 by £50 to £1,150. A car allowance is payable. The post is subject to the Local Government Superannuation Act, 1937, and the successful candidate will be required to pass a medical examination. Applications should be submitted to the undersigned by March 31, 1952.—Eric H. Moore, Medical Officer of Health, Health Department, Sankey Street, Warrington. (9621)

GOVERNMENTAL**CIVILIAN SPECIALISTS FOR THE ARMY
OVERSEAS**

Immediate applications are invited for a limited number of appointments as

CIVILIAN SPECIALISTS IN SURGERY

for service with the R.A.M.C. overseas, in Hong Kong, Singapore, Malaya, Egypt, North Africa, and West Africa, and garrisons in Europe. There are vacancies for men and women. Full particulars and application forms can be obtained from the Under-Secretary of State, The War Office (AMD.1), Lansdowne House, Bekeley Square, London W.1 (telephone inquiries GR05venor 8040 Ext. 548). Salary will be at the rate of £1,800 or £2,200 per annum. To qualify for the salary of £2,200 per annum an applicant must be experienced in the practice of his specialty, and must be a Fellow of one of the Royal Colleges of Surgeons. In addition, except in Germany and Austria, where different arrangements apply, a tax-free foreign service allowance will be paid to meet the extra cost of living at the duty station. Foreign-service allowance varies, according to the station at which employed and the status of the applicant, between £20 and £225 for single men and women and £90 and £390 for married men. An initial outfit allowance of up to £30 will also be paid, except for stations in Western Europe. Leave of 36 days a year may be granted subject to the exigencies of the service. Engagements will be for eighteen months, the whole of which time will be spent overseas. An extension of a further six months is possible. Superannuation

payments under the National Health Service can be continued, if so desired, with the War Department paying employer's contributions. Pension rights under the National Health Service would thus be retained. Service with the War Department will also count for incremental purposes on re-employment under the National Health Service. Free accommodation, and, in some areas, free rations, will be provided for single individuals, but official accommodation will not be available for the families of married individuals. Rent of private family accommodation, and payment of passages for families, are the responsibility of the employee. (9630)

INDUSTRIAL APPOINTMENTS**FACTORY DOCTORS****FACTORIES ACTS, 1937 and 1948**

The following appointments as Appointed Factory Doctor under the Factories Acts, 1937 and 1948, are vacant: Lochwinnoch, in the County of Renfrew; Nairn, in the County of Nairn. The Board will not undertake to incur any expense in bringing any appointees to North Queensland, Australia. (9263)

TOWNSVILLE GENERAL HOSPITAL

Applications are invited for the position of **PART-TIME PHYSICIAN**

Appointee will be required to conduct four sessions of three hours each week, which includes one session during which the applicant is required to act as Supervising Officer of tuberculosis cases. Salary at the rate of £270 per annum per session of three hours. Private practice is allowed. Applications should be addressed to the Secretary, Townsville Hospitals Board, Townsville, North Queensland, Australia. Applicants should state age, whether married or single, and set out full details of qualifications and experience. The Board will not undertake to incur any expense in bringing any appointees to North Queensland, Australia. (9264)

SOUTH INDIA

A British Medical Officer is required for a group of tea estates in South India under British management. Age 30 to 40 years. Single or married. Tropical clinical and hygiene experience an advantage. Basic salary Rupee equivalent of £1,080 per annum rising to £1,350. Cost-of-living allowance and car allowance additional. Bonus dependent on profits. Rent-free house. Applications, with copies of three testimonials and the names of three other persons for reference purposes, to Messrs. Wallace Brothers & Co., Ltd., 4, Crosby Square, London E.C.3.

**TORONTO HOSPITAL FOR TUBERCULOSIS,
Weston****DIRECTOR OF LABORATORY**

English-speaking physician, preferably with interest or experience in bacteriology and pathology. Duties include technical and administrative supervision of ten laboratory staff, gross and microscopic pathology of post-mortem and surgical specimens, also conduct clinicopathological conferences. Starting salary \$4,500 to \$5,500, depending upon experience and qualifications. Congenial working conditions. Proximity to University of Toronto. Living accommodation for single man. Pension, sick leave, four weeks' annual vacation. Address applications, with full particulars, to Medical Superintendent, Toronto Hospital for Tuberculosis, Weston, Ontario, Canada. (9623)

HER MAJESTY'S COLONIAL SERVICE, Malaya

Doctors having medical qualifications registrable by the General Medical Council in the United Kingdom with one or more years' experience after qualification are required for appointment as **MEDICAL OFFICERS and MEDICAL OFFICERS-OF HEALTH**

for General Medical and Health duties

Appointment is available (a) on probation for permanent establishment; (b) on employment from the National Health Service; and (c) on short-term contract with gratuity. (a) **Permanent terms.** Subject to three years' probation, appointment is permanent with pension (non-contributory) at age 55. Salary is paid in the scale £952 by £42 to £1,204 to £1,274 by £42 to £1,652 per annum. There are many posts, specialist and administrative, available on promotion carrying higher salaries (up to about £2,400 for the highest post). Promotion is often made before reaching the top (£1,652) of the long scale. There is also a cost-of-living allowance at varying rates, according to family circumstances, subject to a maximum of £336 per annum for single men and of £707 per annum for married men with children (both rates higher when stationed in Singapore). Note, Doctors with more than one year's approved experience after age 25 (including service in Her Majesty's Forces) enter the salary scale at point above the minimum according to their experience, and four increments of salary are also given to holders of approved higher qualifications (e.g. F.R.C.S., M.R.C.P., D.P.M., D.A., etc.). (b) **National Health Service.** Doctors may resign from the National Health Service but retain their superannuation rights during their time in Malaya (up to six years) and receive a resettlement grant of 20 per cent of the aggregate of their Malaya salary on leaving Malaya at the end of their engagements. Emoluments as under (a), including increments credit for experience and higher qualifications as in note under (a). Doctors so appointed may be considered for permanent terms at any time during their colonial employment provided they surrender their rights to the resettlement grant and paymen by Malayan Governments of superannuation contributions. (c) **Contract terms.** The contract will be for three years' resident service renewable for a further tour of three years by mutual agreement. Salary and cost-of-living allowance as under (a), including incremental credit for experience and higher qualifications as in note under (a). In addition a gratuity earned at the rate of £300 to £450 per annum, according to salary, is paid on expiry of contract. Doctors on contract may be considered for appointment to the permanent establishment at any time on their agreeing to surrender their gratuity earning rights. In all three types of appointment the rates of salary and gratuity refer to doctors eligible for expatriate terms under Malayan Regulations (i.e., those whose permanent homes are in the United Kingdom, Ireland, Australia, Canada, etc.). A limited number of practitioners liable for call up under the National Service Act, 1948, may apply, and if appointed will be granted indefinite deferment of call up on completion of a minimum period of one tour of three years in the Malayan Medical Service. The climate is, for the tropics, healthy. European children do well up to the age of about six and schools are available locally. Income tax is payable at Malaya rates, which are lower than those in the United Kingdom. Government quarters with heavy furniture are provided at a low rental, or an allowance is paid in lieu of quarters. Free passages are provided for the doctor, his wife, and children, under the age of ten (not exceeding four persons besides himself) on appointment and once each way during each tour of duty of three to four years. Generous home leave is granted and local leave is permissible. The social and recreational facilities in Malaya are good. Application forms can be obtained from the Director of Recruiting (Colonial Service), Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1 (quoting reference No. 27215/242/51). (5187)

Overseas—contd.

UNIVERSITY OF MALAYA, Singapore
Applications are invited for three posts in the Faculty of Medicine.

SENIOR LECTURESHIP AND LECTURESHIP IN PHYSIOLOGY

Cost-of-living allowance £294 to £637 per annum according to personal circumstances. Temporary allowance payable to members of staff with medical qualifications £210 per annum. Salaries paid in Malayan currency. Free passages for appointee, wife, and children under 10 years of age. Part-furnished quarters at rent not exceeding 10 per cent of salary, or housing allowance in lieu. Provident-fund scheme on 10 per cent contributory basis. Applications (six copies) with the names of three referees and full details of qualifications and experience, should be sent to the Secretary, Inter-university Council for Higher Education in the Colonies, 1, Gordon Square, London, W.C.1, from whom further particulars may be obtained. Closing date March 30, 1952. (9629)

UNIVERSITY COLLEGE, Ibadan, Nigeria

Applications are invited for a
SENIOR LECTURESHIP IN MEDICINE
Salary on scale £1,500 by £100 to £2,000 per annum. F.S.S.U. Child allowance £50 per annum per child (maximum £50 per annum). Passages paid for member of staff and wife on appointment, annual leave and normal retirement. Part furnished quarters at rent of 7.7 per cent of salary. Applications (six copies), giving full particulars of qualifications and experience and the names of three referees, should be sent to the Secretary, Inter-University Council for Higher Education in the Colonies, 1, Gordon Square, W.C.1, from whom further information may be obtained. Closing date April 19. (9628)

GOVERNMENT OF IRAQ

Expert in sera and vaccines to take charge of Veterinary Laboratory under the Directorate of Veterinary Services. Duties will be preparation of sera and vaccines, and the carrying out of research for rinderpest, haemorrhagic septicaemia, anthrax, black quarter, sheep pox, poultry diseases, and African horse sickness in addition to other animal diseases and epidemics. Qualifications required: degree, with previous experience in scientific research institutes or bacteriological laboratories for not less than five years. Contract will be for twelve months, subject to renewal. Salary up to I.D. 750 per month, according to qualifications and experience. (1 Iraqi dinar equals £1 sterling.) Forms of application may be obtained from Ministry of Labour and National Service, Alimack House, 26-28, King St., S.W.1, quoting A.12/ME/421/51. (9627)

UNIVERSITY APPOINTMENTS**EXETER COLLEGE, UNIVERSITY OF OXFORD
STAINES MEDICAL RESEARCH
FELLOWSHIP**

The Governing Body of Exeter College proposes to elect to a Staines Medical Fellowship in the course of Trinity Term, 1952, to be held from October 1, 1952. The Fellowship is offered for research in Oxford in one of the medical sciences, such as anatomy, biochemistry, clinical science, pathology, pharmacology, physiology. The Fellowship is tenable for a maximum period of five years, and is not renewable. The annual stipend will be £450, together with dining allowance, and, if the Fellow is unmarried, with rooms in college. A housing allowance, at the rate of £50 per annum, is payable to a Fellow, who, being married, resides out of college. If the Fellow has a child or children dependent upon him, he will receive an allowance for every such child who is below the age of 16, or who, being above that age, is receiving full-time education of a course of professional training. This allowance will normally be at the rate of £50 per annum in respect of each child satisfying the conditions of eligibility, but it will be decreased by the amount of any allowance payable in respect of the child from other sources, e.g. the Government and the University. The Fellow will be required to join the Federated Superannuation Scheme for Universities. The Fellow will be allowed to undertake a limited amount of teaching, subject to the approval of the Governing Body. A candidate for the Fellowship must not have exceeded 35 years of age, must be of British birth, and should preferably hold a registrable medical qualification. He should send his application, together with birth certificate, a statement of his career, two sets of copies of his published work, and copies, in triplicate, of three testimonials, to the Rector, Exeter College, on or before March 31, 1952. (9624)

UNIVERSITY COLLEGE, LONDON

Gower Street, W.C.1

**ASSISTANT LECTURER IN ANATOMY
(Full-time)**

to undertake teaching and research in vertebrate embryology

Duties to commence October 1, 1952. Salary £600 to £750 per annum according to qualifications and experience. Superannuation and family allowance schemes. Applications, to be received by May 1, 1952, should be sent to Secretary, from whom further particulars may be obtained. (9588)

**LONDON HOSPITAL MEDICAL COLLEGE
(University of London)**

Applications are invited from graduates, who should preferably be medically qualified, for the post of

LECTURER IN PHARMACOLOGY

which will be instituted in October, 1952. Initial salary within the scale £800 to £1,100, will be dependent on qualifications and experience. The successful candidate will be eligible for membership of the F.S.S.U. and family allowances of £50 per annum for each child. Applications (three copies), together with the names of two referees, must be received not later than March 31, 1952, by the Secretary, The London Hospital Medical College, Turner Street, E.1. (9488)

Children take great delight in singing of ordinary household chores, and they're just as joyous about taking a multi-vitamin preparation—when it's Vi-Daylene. Prescribe Vi-Daylene for your young patients—you know it will be taken eagerly. This well-balanced preparation is ideal for growing youngsters; it is a clear yellow liquid which has a citrus-fruit flavour that children love. They will take it from a spoon with no trouble. This product contains 7 essential vitamins, is naturally stable and therefore can be stored without refrigeration. There is no fishy odour, and it leaves no stain. Vi-Daylene is also a perfect way of administering the necessary vitamins to babies. It is naturally miscible with an infant's milk feed, and makes the addition of cod liver oil and fruit juices unnecessary. Vi-Daylene is available in 90 cc. and 16 oz. bottles.

The average daily dose, one teaspoonful (5 cc.), supplies the following:

Vitamin A, B.P.	3,000 i.u.
Vitamin D (Viosterol), B.P. . .	800 i.u.
Aneurine Hydrochloride, B.P. .	1.5 mg.
Riboflavine, B.P.	1.2 mg.
Vitamin B ₁₂	3 mcg.
Ascorbic Acid, B.P.	40 mg.
Nicotinamide, B.P.	10 mg.

'No need to be afraid...'

Modern analgesia has enabled the obstetrician to give much-needed confidence to the nervous primipara. In the antenatal clinic, an introduction to the simple and effective apparatus which she will use, can assist greatly in allaying the fear of pain.

Today the outstanding value of 'Trilene' in labour is widely recognised. A pleasant and efficient means of producing deep and constant analgesia, it is safe for both mother and infant, and is administered in various types of compact and portable inhaler. There are no contra-indications, and recovery is rapid with no unpleasant after-effects. The advantages of 'Trilene' analgesia ensure the ready co-operation of the patient.

The dangers of **OVERWEIGHT...**

The commonest cause of overweight is over-eating, and the logical treatment for this condition is a reduced diet. Many patients, however, cannot be relied upon to suffer the rigours of self-denial. 'Dexedrine' Tablets curb the appetite of the overweight patient and make it easy to adhere to a low-calorie diet. Weight reduction follows—and is maintained—as a natural consequence, and the dangers of overweight which inevitably threaten health and expectation of life are thus averted.

Regd. Trade Mark BRAND

Standard Interchangeable Ground Glass Joints simplify apparatus assembly

THIS practical development of 'PYREX' Scientific Glassware is strictly in accordance with B.S.S. No. 572/1950.

Because these ground glass joints are standard and interchangeable, they not only simplify apparatus assembly, but also ensure perfect fit and freedom from leaks. Standard adaptors make possible smooth interchange between vessel and vessel.

In addition, the sturdy strength of the joints, and the robust walling of the tubing are a distinct protection against fracture, whether this be due to rapid exchange of temperature or actual physical shock.

These characteristics make 'PYREX' Scientific Glassware distinctly safer and more reliable than ordinary glassware, thus leading to greater economy in usage.

A full list of the various ground glass joints and adaptors is given in our catalogue of 'PYREX' Scientific Glassware which will gladly be sent on application.

CHEMOTHERAPY OF TUBERCULOSIS

Now available!

CALCIUM PAS CACHETS 1.5 gm.
SODIUM PAS CACHETS 1.5 gm.

For Convenience of Physicians requiring widest choice of administrative forms of PAS, the House of Wander announces that 'Aminacyl' PAS Cachets have now been added to its already established 'Aminacyl' range of Calcium and Sodium PAS products.

'Aminacyl' Cachets are a well tolerated and convenient form for both institutional and domiciliary use. Their therapeutic performance is entirely comparable with that obtained with other already recognized forms of 'Aminacyl' PAS.

PACKINGS :—

- 'Aminacyl' Cachets of 1.5 gm. *Calcium PAS*: Tins of 100 and 500
- 'Aminacyl' Cachets of 1.5 gm. *Sodium PAS*: Tins of 100 and 500

The 'Aminacyl' range of PAS specialities also includes Calcium PAS and Sodium PAS bulk powder; Sodium PAS ampoules for topical and ophthalmic use; Calcium PAS and Sodium PAS Dragées; Calcium PAS Granulate.

'Gantresin' is a potent antibacterial substance which is clinically effective in a wide range of systemic and urinary conditions.

It is relatively free from toxic effects, and has few side-reactions. In both free and conjugated forms 'Gantresin' is highly soluble and therefore unless very large doses are used there is no need to force fluids or to give alkali.

The 'Roche' sulphonamide is issued in oral tablets of 0.5 g. in packings of 20, 100 and 500.

ŒSTROGENIC

SEDATIVE

TREATMENT OF THE MENOPAUSE

Liquid. Each teaspoonful contains Stilboestrol 0.25 mgm., Phenobarbitone Sodium $\frac{1}{8}$ gr., with adjuvants in a palatable base.

Provides relief for both mental and physical symptoms.

Dose: One to four teaspoonfuls as directed by the physician.

In bottles of 4 fl. oz., 20 fl. oz. and 90 fl. oz.

Tablets. Each tablet contains Stilboestrol 0.5 mgm., Phenobarbitone $\frac{1}{4}$ gr. and Calcium Phosphate 4 gr.

Prepared for use in conjunction with Stilbagen liquid as a method of varying the dosage of Phenobarbitone and Stilboestrol.

Dose: One or more tablets as directed by the physician.

In bottles of 25, 100, 500 and 1,000 tablets

Aureomycin *Lederle*

for the DERMATOLOGIST

Recognition of the value of AUREOMYCIN in invasions of the skin, by bacteria and certain of the large viruses, is steadily increasing. It has been reported highly effective in:

AUREOMYCIN in an ointment base, provides a mild bacteriostatic and protective application... a powerful therapeutic agent in the management of pyogenic infections. Rapid clearing of dermatologic infections produced by the staphylococcus and other bacteria may be expected.

AUREOMYCIN will control skin infection following extensive burns. In a number of refractory or recurrent dermatoses (including dermatitis herpetiformis, atopic eczema, erythema multiforme bullosum and lichen planus), combined oral and intravenous administration produced superior results.

AUREOMYCIN in capsule form, may prove invaluable for its systemic antibiotic effects in the dermatitides, reinforcing local application. Throughout the world, in every field of medicine, AUREOMYCIN is recognised as the broad spectrum antibiotic of choice.

PROFESSIONAL PROSPECTS*

A COMPARISON OF THE POSITION OF DOCTORS WITH THAT OF OTHER PROFESSIONAL PEOPLE

BY

ROY LEWIS

Struggling with the problems precipitated by the National Health Scheme, the doctor may often be tempted to think that his difficulties are unique. Lawyers, architects, engineers, accountants, schoolmasters, and artists, he may concede, all have their troubles—but, whatever they are, they are not likely to have much bearing on medical professional problems, whose solution can be sought only by doctors wrestling alone with their professional consciences or collectively with the Ministry of Health. But though it is no doubt true that only doctors can solve the problems and resolve the dilemmas which face their profession, a study of the contemporary difficulties of all the professions suggests that doctors share many of their perplexities with lawyers, accountants, engineers, and so on; and that in shaping their course for the future all the professions can gain greatly from a common awareness of each other's position. For the same social tendencies which have made a national health service inevitable have been changing the status and prospects of the other professions. The basic objectives of nearly all professions are the same. May they not have a good deal that is useful, when planning action, to learn from each other? May they not have, even, interests that they should defend together rather than separately?

Industrial Revolution in Medicine

The National Health Service is the latest development in the long social history of medicine. In the past hundred years medicine has undergone an industrial revolution analogous to that undergone by other techniques and callings. The general practitioner has survived, as the hand-loom weaver has not (except in Harris), but a large part of the functions he discharged a century ago have been taken over by the organized medical factory—that is, the hospital and clinic—where specialists of many sorts, not all of them doctors, co-operate to bring any part of the whole range of medical science to bear on every single patient, which would now be impossible for one practitioner alone. In these circumstances the G.P. tends to become a sort of preliminary first-aid casualty-clearing station, plus an organizing and educational centre; anything "big" goes to the "health factory." The G.P.'s function, however, remains a key one—but it has demonstrably changed.

*This paper, which was read before the Hertford Hospital Medical Society, is based on material for a forthcoming book, *Professional People*, by Roy Lewis and Angus Maude, M.P., to be published by Phoenix House, Ltd., next autumn.

That is, broadly, the picture of a hundred years of medical organization, brought about by profound changes in technique and a galactic expansion of scientific knowledge. But one important factor is left out of this equation—and that is the growth of the idea that every citizen in a modern scientific welfare state has a right to enjoy the very best service that the current state of medical science makes possible.

The idea of the right to health is part and parcel of the idea of equality of opportunity, equal shares (or fair shares), full participation in the material benefits of a scientific civilization. The Labour Party manifesto in the 1950 election stated explicitly: "Labour has set out to convert into practical reality the Socialist ideal that the best shall be available to all." The illogicality of the statement is significant, but it is sufficient to note here that any such idea would have seemed nonsense in fact as well as in wording a hundred years ago. Then, it was thought reasonable that you could have as much medical attention as you could pay for—that you could have just as much of any professional service as you could pay for. Almost all professional men worked, like doctors, as individual practitioners and fee-takers. The State hardly ever "laid on" defence—even Army officers purchased their commissions under an archaic conception that the Army should somehow pay for itself. Community doctoring—"public health"—was in its veriest infancy: something Edwin Chadwick was still fighting to make effective.

Expansion of State Services

What has happened since to medicine has happened, to a greater or less degree, to every other profession as the result of these two forces—namely, scientific advances and the idea that every citizen ought to have the benefit of them. The obvious case is teaching; the Education Acts of 1870 to 1902 began the process of providing everybody first with a minimum education and then working towards the idea of giving everybody a maximum education—a full training for his or her trade and profession—laid on free. But every profession has been affected. State health and State education have between them swept many other professions into State service, and even created several new ones—the obvious cases are the dentists, pharmacists, opticians, nurses, medical auxiliaries of all kinds, and the social workers. Something similar is happening to

the scientists, whether industrial chemists, physicists, botanists, or biologists. In the mid-nineteenth century, scientists either taught in universities or worked in their own laboratories in moneyed seclusion. For the public to get the advantages of their services they had to be pulled into the light of day and organized—first, of course, by industrial firms who put money into research, but increasingly by the State, which is to-day probably by far the largest buyer of scientific talent. The State “lays on” science—whether in defence, in food production, in hygiene, in agriculture (home and colonial), or in State industry. The Government operates about 600 research establishments, and in 1945 formally created the “Scientific Civil Service”: science as a public service, in short, like medicine or education.

In law we find the same process at work. The first attempt to give “fair shares” in law, as in medicine, finds its expression in the legal aid scheme. The idea of a State legal service is being applied cautiously; it was because every man paid for his own law that an independent judiciary arose in Britain. The dangers of free State professional services reveal themselves most nakedly in law. None the less, the present half-way house is not in line with the spirit of the age—there is a means test, for example. The pressure for more free legal aid, and certainly free legal advice, is increasing.

Rise in Cost of Professional Services

The reciprocal of State-paid professional services is that the cost of professional services has steadily risen, and continues to rise. This is not a matter of fees (most legal fees have not risen since the 'eighties) but of the cost of organized professional services, and the greater scope of them: innumerable regulations compel the citizen to call in, or make use of, the services of medical officers of health, borough surveyors, accountants, and engineers and scientists of every kind. The fact that the salaries of these experts are paid from rates and taxes does not make them less expensive or less active; and, indeed, their education and training, also increasingly paid from taxes, gets steadily more expensive. This is an important contributory cause to high taxation, which has wiped out the upper classes and is eating into the status and the slender but widely distributed capital reserves of the middle classes. The consequence is that not only has the cost of professional services risen above the ability of the average citizen to buy them, but even the better-to-do can no longer find the money for professional fees. At one time both lawyers and doctors could aid the poor freely or cheaply because they could charge the rich or middle-class client “what the traffic would bear.” To-day the voluntary hospital system would have broken down in any case, because the public has no longer a sufficient margin of income for “voluntary contributions.”

The result is a steady growth in the proportion of professional people in direct State employ, in local government employ, or in the service of indirect State organizations such as the Health Service; the corollary is the ever-smaller proportion of each profession in private practice as it is traditionally understood. Before the war, 40% of the average income of a general practitioner came from panel patients; to-day the average proportion of medical income from purely private patients is tiny—there are some 600 private practices outside the Service, and an unspecified number of private patients going to doctors in the Service. If the income of medical men from outside the Service were 10% of the total it would surprise most of us. But to-day only 52% of registered architects are in private practice; and over a third of the membership of the Society of Incorporated Accountants and Auditors are in public service, a proportion which may not be untypical of the

other accounting institutions. Moreover, the dependence of private practitioners (lawyers, architects, consulting engineers, and consultants of all kinds) everywhere on Government or local government work is well known. How can it be otherwise when the State spends nearly half the national income? In professions where the State does not, in fact, buy much of the professional services offered, a very difficult position exists: only a handful of writers and authors can make a living by their literary work, and hardly a painter or sculptor can live by his art alone; the great majority must find subsidiary incomes, by teaching, by commercial work, and so on. The death of artistic patronage is only one symptom of the general condition which is driving the professions slowly into State employment.

What, then, does State employment imply, and by what means can it be made tolerable to professional ideals? We may examine three important ways in which State employment—and strengthened State control—affects the professions: first, freedom and ethics; secondly, administration and organization; thirdly, remuneration. All professions are affected to a greater or less degree.

State Employment: Freedom and Ethics

The basic professional relationship is between practitioner and client: it is ethical and fiduciary.* It emerges most clearly in the medical profession, because the most precious thing a man has—his life and health—is commonly the subject of the contract between him and his medical adviser. Hence the professional ethic is most highly developed in medicine, and with it is achieved a degree of altruism (however far short of the ideal some, or even many, doctors may fall) not approached in any other profession. Perhaps for this reason the medical code has profoundly influenced the professional conduct of other professions which developed later. The legal ethic is most nearly comparable to that of the medical. The interest of the client comes first; indeed, as Anthony Trollope remarked in *Orley Farm*: “No amount of eloquence will make an English lawyer think that loyalty to truth should come before loyalty to his client.” Among barristers there exists the obligation to serve; in the Law Society and the Bar Council there exist well-developed disciplinary bodies to deal with any practitioner offending against the code, and for maintaining the profession's standards.

It may be argued that the altruism of doctors is not found among lawyers; but in fact the history of law is that of the upholding of individual rights and the maintenance of the independence of the judiciary; the benefits conferred by the English legal profession upon the community have been immense. In other professions the ethical relationship narrows in content, but it is preserved in the relations between client and practitioner. The most important element in the codes of other professions is the guardianship of the client's financial and material interests—for example, the architect, because he must supervise his client's outlays upon building, has a circumspect attitude to observe in his behaviour towards the contractor. An architect working for a contractor may no longer describe himself as an architect. Like a consulting engineer, chemist, accountant, or chartered estate agent, he can be remunerated only by his fees, accepting no commissions, indulging in no advertising.

Many professional people, however, have no individual clients—they are in salaried employment. Their clients are a firm or a Government department. Does this not change the ethical basis of professional service? The question becomes of importance when doctors or lawyers are employed by the State, for a clash of interest may occur—and in fact sometimes does occur—between the employer and the

*There are some possible exceptions to this rule, though the Royal Commission on the Press, for example, considered it held good even for journalists; in the case of the artist, too, the professional services given are such that “the professional must be trusted to give what he cannot be compelled or contractually bound to give” (T. H. Marshall, *Citizenship and Social Class*, p. 135).

individual for whom the employer is laying on the service. Ultimately the patient or client is the employer—through the part he plays in representative Government—but in fact Departmental policy and the machinery of administration put a huge barrier between the citizen as consumer of some social service and the citizen as employer of the man who dispenses it to him. Some people have taken the view that the old ethic which existed between client and practitioner is in some way “sublimated” by professional people in Government employ to a general obligation of self-abnegating service to the community at large. It was Lord Dawson of Penn who remarked: “A doctor’s vision, hitherto focused on the individual, will extend its range so as to embrace the community. Professions, like individuals, have their phases of development. In the medical profession to-day we see the dawn of the civic conscience.”*

The Professional Conscience

All professions should have a civic conscience—in proportion as they receive, by Act of Parliament or Royal Charter, special privileges and protection; they are under the obligation to maintain the standard of their service and to advance in the public interest their science or their art. Obviously true of medicine, this is no less true of engineering, law, applied science, or even architecture and art. Professional institutions and individual professional men must play an ever-increasing part in shaping social policy—through representative organs of Government. But this is far from superseding the basic ethic—which is the fiduciary and confidential relationship towards the client, whose true interests are paramount. From this it should follow that, whatever the duties of medical officers of health, or medical advisers in Government departments, what really matters to the doctor—G.P. or specialist—is the patient, not the paymaster. The lawyers have taken care that payment under the legal aid scheme shall be disbursed by the Law Society, though it comes from the Treasury; this arrangement emphasizes the fact that the practitioner must not be influenced by any loyalties other than those to the client. It should certainly not be assumed that “among reasonable men,” such as Civil Servants and other professional people account themselves, no clash of loyalties may be anticipated. Anyone with experience of working with large organizations knows they do take place; all professions find it so. And what starts with small matters goes on to major points of principle. An interesting but by no means isolated example is that of the probation officer, a servant of the Court, who comes to think of himself inevitably as “treating” the offender in a confidential capacity, and often finds a conflict between his instructions from the Court and what he sincerely considers are his “client’s” best interests.†

Professional people in salaried positions should feel that they belong not to their immediate paymaster in matters of conduct but to their profession, but what makes this profession, and its code, is the tradition of private practice. The danger is that, if private practice should dwindle below a certain critical point, that tradition may lose its power over new generations of students and graduates. The tendency to think more of the employer’s interests and less of the client’s may be speeded up as the “expert” finds himself in charge of an ever more complex machine for doing good generally, instead of looking after Mr. Brown and Mrs. Smith and Master Robinson in particular. For this reason the present position of the general medical practitioner is of special importance. In the Health Service the doctor-patient relationship will remain, while some private practice in the old tradition will survive outside it and in competition with it; and in medicine, therefore, the true professional conscience can be kept alive, and can set the tone, not only for the rest of the medical profession, but for all the professions which try to take their tone from the medical ideal. The general practitioner who insists on

acting as the patient’s servant first and foremost is performing a first-class service not only to the medical profession but to all the others in which the State is gaining power at the expense of the private practitioner.

Organization

The second effect of growing State power is upon organization. Professions should be self-governing, whatever stipulations the State may make regarding the nature of qualifications or of conduct: this follows from the practitioner-client relationship, for only the profession knows how best to preserve trust in itself. It demands independence. Where there is no independence there is trouble. Teachers suffer from a lack of true professional organization: bossed by the Ministry of Education and local authorities to an unreasonable degree, humiliated in pay and status—even inspected to make sure they are not colluding their professional duties—they have taken refuge in trade unionism. That is the danger which faces all professions to-day, and many are alive to it. It is interesting to note that the nationalization of mines has been followed by the development, on the part of mining engineers, of the Institution of Mining Engineers as a fully examining and qualifying body. Now that the State controls the mines, besides setting the standard of the certificate for colliery managers, the profession instinctively feels it must develop its independence through a body free from the State and capable of maintaining higher standards. The gas engineers have reacted to gas nationalization from similar professional instincts. When there were 1,000 gasworks as separate employers, the Institution of Gas Engineers accepted a subsidy from the gas companies to act as an examining and professional body. To-day that subsidy comes entirely from one source—the State—and the gas engineers have reacted by handing the control of examinations and qualifications over to the completely independent Institution of Civil Engineers.

The State has an inveterate tendency to do things on the cheap; to do things on the cheap it is necessary to lower standards. The proposals to introduce a new series of qualifications for engineering, technology, and commerce, based not on the training and examinations of the existing senior engineering, scientific, and accountancy institutions but upon an entirely new system of State technological education, is being strenuously opposed by the older professional bodies, who see in it a threat both to their independence and to the educational standards in their professions. They anticipate that it would not be long before State-certificated engineers, accountants, and technologists would be employed in Whitehall departments, in local government, and in nationalized industries in preference to properly qualified men and women; cheap engineers, in fact, to match cheap teachers. There may appear at present to be little danger of State production of cheap doctors—but this tendency should be watched and fought.

The Threat of Administration

The other threat from the State to the independence and integrity of the professions comes from the growing importance of administration. When all professions consisted of private practitioners there was no administration. The only administered professions were the Army and Navy, where an interesting mixture of anarchy and red tape was the rule. The introduction of social services, the socialization of professional work, bigness, centralization on Whitehall, technical advances, have completely changed the picture. Doctors found themselves faced with the choice either of getting their hospitals managed by laymen, and devoting themselves to their patients, or of reducing their professional work in order to find time for administrative duties. The engineer has to decide, likewise, at what stage to cease designing machines and become a manager or an administrative officer; the scientist must also forsake research in response to the same call, or acquiesce in the “co-ordina-

*Francis Watson, *Dawson of Penn*, 1950, p. 171.

†Cf. *Social Case Work*, edited by Cherry Morris, 1950, pp. 127 et seq.

tion" of his and his colleagues' work by a layman and perhaps even an accountant. Administration is gobbling up professional talent at a phenomenal speed.

There are two schools of thought about this. One school holds that an entirely distinct profession of administrators should be created to enable the technical people—doctors, nurses, medical auxiliaries, engineers, teachers, scientists—to get on with their "real job": selected, trained, and examined for management, these administrators should "run" the technicians efficiently and expertly. The second school holds, on the contrary, that professional people must themselves do the administration of their professional services to the community; whatever the cost in personal frustration, they must never relinquish control, for they alone can understand or discover how to organize themselves. This school avers that the conception of a distinct profession of managers and administrators is vague and illogical. The universities have firmly kept out the professional manager; the scholars run themselves—and thereby preserve a large measure of independence despite State finance of university teaching and research.* In medicine, while there is still much administration by doctors, and always will be, a new administrative profession is being allowed to grow up. In big business, it is still being argued whether managers should be trained to administration and then be put in authority over scientists and engineers, or whether the technicians should be advanced to top management if they reveal flair for organization and leadership.† Government and business experience strongly suggests that where you have administrators organizing the work and conditions of service of professional people you have among the professional people a strong sense of frustration, and a conviction that the administrators are inefficient, fussily tyrannical, and grossly overpaid in relation to professional earnings. The administrators in these circumstances are often defensive and irritable, or intolerably cocky.

There can be little dispute that one race of trained administrators we must have—the administrative grade of the Civil Service to enforce the laws and regulations with justice and efficiency; although, as the State increasingly enters the field of social services and production, "professional Civil Servants"—doctors, lawyers, accountants, and technologists—must increasingly be advanced to administrative posts otherwise held by departmentally trained administrators. But in local government there is no "heaven-born" administrative grade; and it has not been proved that such a grade or specialist is required anywhere else. On the contrary, there is every evidence that a sound professional training, whether medical, legal, or technological, supplies the best foundation for the development of the personalities and powers of those with gifts for organization and leadership. Only a limited proportion of people with professional or any other training show such a flair for organization and leadership; too few, indeed, to fill the many posts of supermen which the welfare state and the Socialist cult of bigness in organization create. This is the inherent weakness of bigness, however, and the training of administrators will not mend it. On the other hand, it is vital that the professions should retain their own government in their own hands, even if, in the case of medicine, this means losing hundreds of first-class doctors to desk work.

Professional Remuneration

In Mr. Attlee's phrase, we are trying to do too much too soon: that is the reason why almost every profession, except the stage and letters, complains of being undermanned. Our aim is apparently to give the country a higher, more expensive standard of life and welfare, equally shared, than our supply of brains, administrative and professional, will run to. It is important to note that, politically, what matters now is to give everybody *some* sort of service, even if this involves a drop in the standard. Politicians want to be able

to say they have done this and that—that it is on paper, written in the Statute Book. Generally, their attitude to standards is that the masses probably don't know any better, and will take what they are given provided they do not see others getting more. This attitude has important consequences for the remuneration of professional people. What the State wants is enough doctors to run some sort of free health service, enough teachers to run some sort of universal free education, enough lawyers to run some sort of free legal aid scheme, and so forth. There is just so much money for all these welfare services, and to the State quantity matters more than quality. The result is that the State looks with a jealous eye on professional salaries. The traditional desire to save public money is now reinforced by new pressures to lower professional remuneration—one of them being the expense of complex administration, and another being the egalitarian spirit of the times. Moreover, if standards are lowered, it follows, to the official way of thinking, that a cheaper type of "expert" can be employed to supply the service in question.

So long as private practice and forms of alternative professional employment exist, it is possible to resist this tendency. The State is getting inferior scientific and technological talent because it offers salaries inferior to those obtainable in large firms and conditions infinitely irksome when compared with those prevailing either in industry or in the universities. With growing State control of secondary education, we see a narrowing of the wages differential between schoolmasters with university degrees and those with teachers' certificates only. It is rumoured that in gas and electricity, as senior posts become vacant, less well qualified engineers at lower grades of salary are put in charge. When this process reaches the coal mines (and those who have seen the material now being trained as colliery managers for the future are not reassured) and the nationalized steel industry (if it remains nationalized) the nation will feel the effects. Many of the best technologists have deserted coal, and some are thinking of deserting steel; there are, of course, many posts in private industry at home or overseas for them to fill. So long as alternatives exist there will be a limit to what the State can do to earnings in any one profession. If it lowers standards and remuneration too fast, moreover, it is likely in some cases to increase outside competition. The first effect of the 1944 Education Act, which foreshadowed a reduction in the quality of grammar-school education, was to lengthen the waiting-lists for private schools; while the queues for hospital attention in the Health Service seem to be significantly reviving medical private practice outside the Service. This competition, of course, is something the State will smash if it can: it is necessary only to refer to the behaviour of the Road Haulage Executive towards private hauliers, or the State airlines' attitude to charter companies.

Conclusion

It was Babeuf, the French revolutionary, who cried: "If it destroy civilization itself, we must have absolute equality." Absolute equality in professional services might well destroy their humanity with their progressiveness. To retain their humanity, to maintain their progress, each profession must keep its independence so far as it can; and when it is necessary to make difficult choices—the problem of old people, the problem of the school dental service, and so on—it is the profession, not Civil Servants or professional managers, who generally should make them. What money the nation can afford for health services should be spent by doctors, in the way they think best, in the terms of their own professional ideals. That such a decision shall be wise, and be made from good motives, our need of an independent medical profession is second only to our need of an independent judiciary. It is therefore vital, not only in their own but in other professions' interests, that doctors

*D. Veale, "University Administration," *Fortnightly Review*, November, 1951.

†Peter F. Drucker, *The New Society*, 1951, pp. 194 et seq.

should not allow Health Service conditions to undermine their independence or their essential relation to patients.

If my analysis of the professional situation to-day is reasonably accurate, a number of things will be necessary; important among these are:

(a) Medical organizations should spend the money allocated by the State to the National Health Service; doctors should be employed by doctor-administered organizations.

(b) Standards of qualification and performance must be defended.

(c) A stand must be made against the lowering of rewards, but public sympathy for such a stand must be developed by sound public relations.

(d) A realization by specialists and hospital doctors of the true importance to the profession of the general practitioner inside the Service: if the G.P. loses caste the public will tend to think of all medical men as mere purveyors of wrapped-up scientific cures, payable at shop clerks' rates.

(e) A realization by all doctors in the Service of the great benefits to be gained by the whole profession from the survival of private practice outside the scheme. It is a sound insurance policy; the profession should do all it can to extend every possible aid to the private practitioner, and fight the State's attempt to penalize him.

(f) The reconciliation of differences between doctors and medical auxiliaries. The medical auxiliaries' status and standards should be raised; and the State given no chance to drive any wedges between the "health professions."

(g) A new approach to administration. Every profession faces here a problem of unexampled urgency. It is foolish to leave the field to lay administrators. There is certainly need for a staff college for the scientific and technical professions; and probably one for the medical profession and all its auxiliaries as well.* How many hospitals have sent doctors to the administrative staff college at Henley meanwhile?

(h) And, finally, the maintenance by every means, personal and propagandist, of the basic ethical relationship between doctor and patient. People basically do not want official doctors, and they might well learn to prefer a less generous Health Service to losing the sort of doctor they traditionally know, like, and trust.

Let us make no mistake, when all professional people are officials there will be no doctors, no lawyers, no artists, and probably no scientists either. There will be no professions; and no life worth living. George Orwell in his *Nineteen Eighty-Four* depicted the sort of life there will be.

One other thing is needful: greater understanding by the professions of each other's problems, and the making of a common stand when this proves practicable. The leadership of this country is now largely professional. The aristocracy is gone; the propertied classes are dying; business is half-professionalized. The bureaucracy is calling in the professions more and more. Should not, then, professional leadership be consciously professional? Professional training and practice gives a man or woman a maturer outlook on affairs than is possessed by any other section of the community; in understanding the professional ideal (largely shaped by generations of doctors) and in seeking to pass it on to the rest of the community—to the business men, to the traders, to the farmers, to the technicians, to the trade union executives, and so to the operatives, supervisory, skilled, and semi-skilled—we have our best chance of restoring balance and vision to our community, which, packed fifty million on this small island, is so sorely beset.

HORMONE ASSAYS IN NORMAL AND ABNORMAL PREGNANCIES*

BY

G. I. M. SWYER, D.M., D.Phil., M.R.C.P.

Consultant Endocrinologist to the Obstetric Department,
University College Hospital, London

The accompanying list (see Table) of hormones of actual or potential interest in pregnancy is a formidable one, and is not necessarily complete. Assay methods for several of them are still imperfectly developed, so that it will not be possible (or necessary) to devote equal attention to each of them. A word of explanation, though scarcely of apology, is perhaps necessary in the

Table of Hormones in Pregnancy

Oestrogens:	
Oestradiol	
Oestrone	
Oestriol	
Progesterone—Pregnanediol	
Chorionic gonadotrophin	
Pituitary hormones:	
Anterior-lobe hormones	Prolactin Growth hormone Adrenocorticotrophic hormone Thyrotrophic hormone
Posterior-lobe hormones	
Adrenocortical hormones:	
"Corticoids"	
17-ketosteroids	
Other cortical metabolites	
Thyroid hormone (serum precipitable iodine)	
(Serum histaminase)	
(Serum pitocinase)	

case of the last two items, the enzymes histaminase and pitocinase, included within parentheses. Hormones and enzymes have a good deal in common, so that their presence in the list is perhaps not so surprising, and their presence in blood only during pregnancy entitles them to some consideration in this paper. The plan to be followed will consist of a description of the findings in normal pregnancy* first, followed by a survey of what is known of the hormonal findings in abnormal pregnancies.

Oestrogens

Although wholly satisfactory methods for the assay of oestrogens in body fluids still await development, and estimates of their levels in conditions other than pregnancy must be accepted with great caution, there is no doubt that such a plethora exists in pregnancy that even crude methods have yielded highly significant information. The general pattern of oestrogen excretion in the urine during normal pregnancy is now generally well known and needs little comment. As can be seen in Fig. 1, during the first trimester the levels are low, scarcely differing from those of the menstrual cycle, but thereafter a tremendous increase occurs in the oestriol fraction, and a very much smaller increase in the oestrone and oestradiol fractions. During the last two weeks the oestriol fraction decreases rapidly, reaching early pregnancy values by the onset of labour. The oestrogens are excreted almost exclusively in the combined form, as sulphates or glucuronidates, and as such are biologically relatively inactive.

*Paper read at the International Congress of Clinical Pathology, London, July 16-20, 1951.

FIG. 1.—The average urinary excretion throughout normal pregnancy of chorionic gonadotrophin, pregnanediol, oestrone, and oestradiol.

Since the work of Cohen, Marrian, and Watson (1935) it has generally been accepted that at the onset of labour, when the level of combined oestrogens has fallen markedly, free oestrogens suddenly appear in great excess. It has been thought that a causal connexion between the onset of labour and this change in the chemical state of the oestrogens might well exist. On the other hand, not all authors have invariably found such a rise in the free oestrogen at the onset of labour, and some doubt has therefore arisen whether or no such a rise was indeed significant. The recent investigations of Clayton and Marrian (1950) have shown that the explanation of the observed appearance of large amounts of free oestrogen at the onset of labour is contamination of the urine with blood or amniotic fluid. These substances contain large amounts of enzymes— notably glucuronidase—which are able to hydrolyse the conjugated oestrogens. So passes another plausible, but unfortunately incorrect, hypothesis seeking to account for the onset of labour.

The oestrogen content of the blood during pregnancy has been less studied than that of the urine, because it is much more difficult to obtain even remotely plausible results. It seems probable, however, that the blood levels vary similarly to the urinary levels. It is pertinent to point out that most of this work has been done with the use of biological assays; if these are not preceded by fractionation into the three oestrogens, interpretation of the oestrogenic potency of the mixture in terms of a single oestrogen (usually oestrone) is very difficult, since the potencies of the separate oestrogens are different, vary according to the method of assay used, and are not additive. Moreover, there may be present augmenting and inhibiting substances, about which knowledge is meagre. In most published studies little or no attention has been paid to these aspects.

Progesterone and Pregnanediol

If we take into consideration the difficulties of assaying progesterone—which still await adequate solution—it is surprising how much we know, or think we know, of the role of progesterone during pregnancy (see Kaufmann, Westphal, and Zander, 1951, for a recent review). Virtually none is present in the urine—and there does not seem to be much in the blood either. The corpus luteum during the first trimester, and the placenta in increasing amounts thereafter,

do contain it. Most of our information is derived from studies on the urinary excretion of pregnanediol—a dihydropregnane alcohol first isolated from pregnancy urine in 1929 by Marrian, and, since Venning (1937, 1938) described her gravimetric method for its estimation, the subject of numerous investigations. It has been assumed, more or less tacitly, that the pregnanediol excretion in the urine reflects the metabolism of progesterone (see formulae for the close chemical relationship between the two steroids). Very probably this is in general true, but the complete proof is still lacking, and it is conceivable that, in some circumstances at least, the parallelism is far from close.

Pregnanediol is excreted in the form of sodium pregnanediol glucuronide, and in the original Venning method is measured as such. Most of the more recent assay methods have combined hydrolysis with extraction and thus determine free and combined pregnanediol together. This is advantageous, since partial hydrolysis may take place in the voided urine, thus causing variable losses of pregnanediol glucuronide. It would be out of place to discuss in detail the various assay methods which have been developed in recent years, but, disregarding the older techniques, it may be said that they fall into two main groups—"rapid" methods, intended for clinical application, and quite unsuitable for dealing with the small amounts of pregnanediol found during the luteal phase of the menstrual cycle; and longer methods, intended for careful research and applicable to small amounts. In the first group comes the Guterman method (1944) and, distinctly preferable, the method of Sommerville, Marrian, and Kellar (1948). In the second group come the method of Sommerville, Gough, and Marrian (1948) and the ingenious technique of Huber (1947) and de Watteville *et al.* (1948), which employs adsorption chromatography with alumina for purifying the pregnanediol.

As can be seen in Fig. 1, the pregnanediol excretion in normal pregnancies shows a slow rise during the first 20 weeks, reaching a level of 20–30 mg. per 24 hours. Thereafter the rise is increasingly rapid, a peak, in the region of 90 mg. being attained about the 37th–38th week. The excretion then drops rapidly, disappearing altogether a few days after delivery. It must be emphasized that variations from this mean curve are considerable even in apparently normal pregnancies, so that the interpretation of isolated determinations may be difficult or impossible.

A number of attempts have been made to use pregnanediol assay as a method of pregnancy diagnosis, since it is obvious that an accurate and relatively simple chemical method would have distinct advantages over biological procedures (Guterman, 1944, 1945; McCormack, 1946; Reinhart and Barnes, 1946; Merivale, 1948; Henderson *et al.*, 1949; Swyer, 1949; de Watteville, 1951; *etc.*). The reliability of the results has varied markedly in different reports, and a considerable literature has developed, arguing the case for and against. It is unnecessary to enter into the controversy here, but one conclusion is inescapable: the amounts of pregnanediol excreted during the first few weeks of pregnancy—that is, after the period has been missed—may be no different from those during the luteal phase of the normal cycle, so that on these grounds alone the theoretical basis for the test becomes invalid. The exclusion of all cases in which bleeding has occurred after the suspected onset of pregnancy, as Guterman (1945) considers essential, clearly limits the value of the test considerably. It seems fair to state that, although some authors have found the test as reliable as the Friedman test, since many others—for example, Reinhart and Barnes (1946), Merivale (1948), and

Swyer (1949)—have reported very different findings, pregnanediol assay is not to be recommended as a worth-while substitute for the established biological methods of pregnancy diagnosis.

Chorionic Gonadotrophin

The "pregnancy hormone" *par excellence* of the human (though apparently not necessarily of most other species) is chorionic gonadotrophin (C.G.) (also known as "anterior-pituitary-like hormone" and prolan) since it occurs only during pregnancy—if we except certain relatively rare teratoid tumours of so-called chorion epitheliomatous type. Curiously enough, it cannot be said that we are at all certain of its function during pregnancy; and there is no doubt that its peculiar curve of production (Fig. 1) remains unexplained. It is the substance responsible for the reactions which provide the basis of biological pregnancy diagnosis tests, causing ovulation in immature mice (Aschheim-Zondek test), in mature rabbits (Friedman test), and in the South African clawed toad (*Xenopus laevis*); and causing the appearance of spermatozoa in the cloacal urine of the male South American toad (*Bufo arenarum* Hensel) and in the North American leopard frog (*Rana pipiens*). Probably the most satisfactory quantitative method for its assay is that developed by Loraine (1950) employing the weight of the immature rat's prostate.

C.G. first appears as soon as the fertilized ovum has become embedded, and is believed to be formed by the trophoblast. It has been detected as early as the 25th day after the beginning of the previous period (based on a 28-day cycle) and therefore before the next period has been "missed." Its excretion in the urine rises rapidly, reaching values between 20,000 and 40,000 i.u./24 hours between the 40th and 80th days of pregnancy. By the 100th day the peak period is over and a relatively steady level is maintained until the end of pregnancy. Loraine regards the normal range for this level as between 4,000 and 11,000 i.u./24 hours. A slight but apparently significant rise occurs about the 37th week of pregnancy, and after parturition the hormone rapidly disappears from the urine, none usually being detectable by the fourth day after delivery.

Some simple arithmetic applied to these values gives interesting results. It is probable that 15 i.u. or more of C.G. is required to produce ovulation in the rabbit—that is, to give a positive Friedman test—and, since 10 ml. of urine is usually injected, it follows that not less than 1.5 i.u./ml. must be present. Assuming the first morning specimen to have twice the concentration of the total 24-hour specimen, and assuming a 24-hour volume of 1,500 ml., this implies that, in general, the 24-hour excretion must exceed 1,125 i.u. in order that a positive Friedman test may be obtained—and, clearly, this value will usually be greatly exceeded. But it is easy to see how this lower limit may occasionally have to be raised three to four times in order that a positive result may be obtained, thus accounting for the occasional false negative tests early in pregnancy—especially before the sixth week—and later on after the peak has been passed. Similar calculations applied to the peak period show that a positive result at 1:10 dilution—that is, with 1 ml. of urine—will generally be obtained, and occasionally the result may be positive at 1:100 dilution—that is, with 0.1 ml. of urine. Between the 40th and 80th days, therefore, a positive Friedman test at 1:100 dilution may be physiological and not indicative of hydatidiform mole.

The distribution of C.G. in mother and foetus has been studied by Bruner (1951), who found the concentration always to be highest in the chorionic placenta, thus supporting the view that the hormone originates in the trophoblast. In the mother, the highest concentration was found in the blood, the endometrium coming next and being richer in the hormone than any other tissue. The concentration in the foetus is very low, being about 1/10 to 1/20 that in maternal muscle; nevertheless it was thought that the total amount of C.G. reaching the foetus might be of physio-

logical significance. Evidently, therefore, the hormone is released by the chorion into the maternal blood stream, from which a small amount passes the "placental barrier" to enter the foetal blood stream.

Anterior-pituitary Hormones

The substances of potential interest under this heading are prolactin, growth hormone, adrenocorticotrophic hormone and thyrotrophic hormone. No simple methods for the assay of any of these are available and knowledge of their behaviour during pregnancy is slight. The fact that the pituitary enlarges during pregnancy has led many to suppose that it becomes more active at that time. Direct evidence supporting this view is very scanty. Prolactin is probably produced in small amounts during pregnancy, but apparently (Lyons and Page, 1935; Meites and Turner, 1941) in considerably larger amounts *post partum* (not altogether confirmed by Coppedge and Segaloff, 1951). The possibility of increased growth hormone production during pregnancy, particularly in the diabetic and pre-diabetic woman, and of its implication in the foetal complications in those conditions (Barns and Morgans, 1948; Gilbert, 1949; Barns *et al.*, 1950), is an interesting speculation not yet susceptible of proof. Recent investigations seem to indicate an increased production of A.C.T.H. during pregnancy (Parrott, unpublished); the increased secretion of some adrenocortical steroids (see below) certainly suggests the probability of such an augmentation. Swelling and hyperplasia are often observed in the thyroid gland during pregnancy and suggest increased thyrotrophic hormone production, but no accurate studies have lent support to this view.

Thyroid Hormone

It is now usual to regard the serum precipitable (or protein-bound) iodine (S.P.I.) as giving a measure of the amount of thyroid hormone present in the blood. In normal non-pregnant women this value varies between 4 and 8 μ g. per 100 ml. of serum. Peters *et al.* (1948) found that from the second month the level rose to a mean of 8.3 μ g., the range being 6.2 to 11.2 μ g. They observed that this rise in S.P.I. occurred much earlier in pregnancy than that in the B.M.R., which begins only after the fourth month.

Adrenocortical Hormones

Venning (1946) has studied the output of adrenal steroids during pregnancy and has shown that the glycogenic corticoids—that is, those able to cause deposition of glycogen in the livers of adrenalectomized mice—increase in a complex fashion (Fig. 2). There is a rise to about twice the normal value, coinciding with the gonadotrophin peak, followed by a fall, with a subsequent rise to about four times the normal value during the third trimester. Using chemical methods, other workers (Heard *et al.*, 1946; Tobian 1949) have shown similar rises in the neutral lipid-soluble reducing fractions of the urine during pregnancy, though the increases are less than those found by the biological method. There is as yet no means of separately estimating the so-called glucocorticoids and the mineralocorticoids; indeed, the validity of such a differentiation is doubted by some. It should also be remembered that there is an increasing awareness of the defects and limitations of all hitherto proposed methods for determining the excretion of adrenocortical metabolites (cf. Marrian, 1951).

By contrast, the 17-ketosteroids (representing roughly the "androgenic" activity of the adrenal cortex), when measured by the Pincus reaction (which uses antimony trichloride), shows practically no change throughout pregnancy. On the other hand, with the Zimmerman reaction (using *m*-dinitrobenzene in alcoholic potassium hydroxide), a progressive rise is found during the second half of pregnancy. Now the Zimmerman reaction is also given by 20-ketosteroids (such as pregnanolones), so that

FIG. 2.—The urinary excretion throughout normal pregnancy of "corticoids," 17-ketosteroids, and the suggested excretion of pregnanolones

Venning (1946) has suggested that this discrepancy between the two methods might be due to the excretion of increasing amounts of pregnanolones, and, since these give only about one-eighth the colour of 17-ketosteroids in the test, it would follow that their excretion would apparently rise to something like 80 mg. per 24 hours at full term (Fig. 2).

If the increased secretion of corticoids—that is, compounds related to corticosterone—during pregnancy is due to increased stimulation by A.C.T.H., it must be concluded that the activity of the adrenal cortex is modified during pregnancy, since in the non-pregnant state the typical response of the adrenal to A.C.T.H. involves the 17-ketosteroids as well as the corticoids (the latter, however, to the greater extent).

Posterior Pituitary Hormones—Pitocinase

There have been no convincing studies of the production of posterior-lobe principles during pregnancy. Page (1947), however, has shown that there is a remarkable increase in the pitocinase activity of plasma during pregnancy, the level near term being several thousand times that at conception. Indeed, during the first 16 weeks of pregnancy the increase in activity follows a linear function and can be made the basis of a test for determining the duration of pregnancy. Though the significance of this enzyme is still far from clear, it would seem that its increased production serves to prevent the stimulating action of "pitocin" on the uterus, and its sudden disappearance at term would have an obvious association with the onset of labour.

Serum Histaminase.—Another enzyme characteristic of pregnancy is histaminase, which arises in the placenta and appears in the plasma only during gestation. Numerous methods for its assay, some chemical, some biological, have been proposed from time to time, but hitherto all have had their drawbacks. A very recent method described by Kapeller-Adler (1951) seems much more promising and has the great advantage of simplicity. It depends upon the fact that during the action of histaminase on histamine in the presence of indigo carmine one molecule of H_2O_2 is formed for each molecule of histamine oxidized, so that the amount of unoxidized indigo can be estimated by titration with $KMnO_4$, thereby giving a measure of the histaminase activity.

The histaminase content of the plasma bears a close relationship to the functional capacity of the placenta and shows a sharp rise from about the 14th week of pregnancy, reaching a peak value near the 26th week which is about eight times that found before the 14th week. Thereafter it falls slowly until term, disappearing altogether within four to five days of parturition.

Hormonal Findings in Abnormal Pregnancies

Toxaemia of Pregnancy

Since this condition (the "disease of theories") is one of the two outstanding unsolved problems of obstetrics (the other being uterine inertia), it deserves consideration first. A very able review of the subject has been given by Smith and Smith (1948), who summarize the findings as follows: in eclamptogenic toxaemia there appears to be (1) excessive antidiuretic substance in the urine and placenta; (2) a melanophore-expanding principle (perhaps from the intermediate lobe of the pituitary gland) in the blood and placenta; (3) a hypersensitivity to the injection of posterior pituitary secretions (this probably indicates deficient production of pitocinase); (4) high titres of C.G. in a large percentage of cases; (5) decreased excretion of oestrogens and pregnanediol; and (6) histological and histochemical changes in the placenta similar to but more marked than those of the normal placenta at term and primarily involving degeneration of the syncytial cells which probably secrete the steroid hormones.

Some further comment in relation to the oestrogens in toxaemia is pertinent. The Smiths, impressed by the apparent reciprocal relationships of oestrogens and C.G., believe that the latter is utilized by the placenta for the production of oestrogen and progesterone. In many cases of toxaemia they observed a rise in C.G. coinciding with a fall in oestrogen and pregnanediol excretion. This they have interpreted as being due to failing utilization of C.G. because of degeneration of the syncytial cells. In those cases of toxaemia in which C.G. was found to be present in normal amounts they further postulate decreased production of C.G. as a secondary result of placental damage. Their studies of the excreted oestrogen fractions and oxidation products have led to the formulation of a scheme of oestrogen metabolism in which progesterone facilitates the conversion of oestradiol to oestrone, which is then further transformed to oestriol as follows:

They believe that the oxidation products stimulate the production of oestrogen and progesterone through the increased utilization of C.G.; and, further, that stilboestrol behaves in this respect like the oxidation products in causing a fall in serum C.G. and an increase in pregnanediol excretion in pregnant women. The fall in serum C.G. has been confirmed by Loraine (1949), who has shown, however, that it is transient, the C.G. level rising again even though stilboestrol administration be continued. The increased excretion of pregnanediol has not been confirmed. Indeed, Sommerville, Marrian, and Clayton (1949) have found that stilboestrol regularly decreases the excretion of pregnanediol, which rises to the normal level again on stopping the stilboestrol. These authors suggest that the Smiths' findings on pregnanediol excretion might be explained by the fact that, having used the Venning method which determines sodium pregnanediol glucuronide, they would probably also be measuring at the same time some conjugated excretory product of stilboestrol. The Smiths are not satisfied with this explanation, and the controversy still is unsettled.

Some older observations—for example, those of Fauvet and Münzner (1937)—seemed to indicate decreased adrenocortical activity in toxæmia of pregnancy, but more recent studies point in the direction of increased activity, particularly with respect to the corticoids. Thus Tobian (1949) found that whereas during the last trimester in normal pregnancies twice as much corticoid is excreted as by non-pregnant women, a still higher corticoid excretion was seen in women with excessive oedema (46% more, which is statistically significant). Twin pregnancies were also associated with increased corticoids. There was no correlation between the elevation of the blood pressure in toxæmia and the corticoid excretion, but in essential hypertension in pregnancy no abnormal changes in the corticoids were seen. In addition to the rise in corticoid excretion, Devis and Eeckhoudt (1949) claim to have found abnormally low 17-ketosteroid outputs and seek to ascribe to this alleged hormonal imbalance an aetiological role in toxæmia of pregnancy. It seems fair, however, to point out that the hormonal findings might just as well represent the reaction of the adrenal cortex to the stress imposed by the disease. There is general agreement that the histaminase content of the plasma is significantly reduced in toxæmia of pregnancy, the degree of reduction being related to, the disturbance in functional capacity of the placenta. The new simple method of Kapeller-Adler already mentioned may prove to be of real clinical value in helping the obstetrician to decide when, because of the failing placenta, the pregnancy should be terminated to avoid intrauterine death of the foetus.

In *hyperemesis gravidarum* there is reason to believe that C.G. levels are sometimes abnormally high. A plausible explanation of the condition is that it represents a hypersensitivity response to what is essentially a foreign protein. Clearly, therefore, excess of C.G. is not indispensable for the production of the condition, and such an excess is not always found.

Hydatidiform mole, on the other hand, is almost invariably accompanied by a greatly increased output of C.G., so that usually as little as 0.1 ml. of urine will give a positive Friedman test—that is, 1:100 dilution. A similar positive response (though usually in a lower dilution) can be obtained with cerebrospinal fluid. It has already been pointed out that, at the peak of C.G. excretion—that is, about the 60th–70th day of pregnancy—positive Friedman tests are sometimes obtained at similar dilutions in normal pregnancies, and particularly in multiple pregnancies. It is therefore easy to be misled by such a finding, at about the 10th week, if there is some vaginal bleeding together with a twin pregnancy—so that the uterus would seem larger than the expected size. The fact that pregnanediol excretion has been reported as zero in hydatidiform mole (Guterman, 1945; McCormack, 1946; Swyer, 1949) engendered the hope that its measurement might help to disentangle such a problem, but there is now no doubt that the absence of pregnanediol in cases of hydatidiform mole is not invariable, and its assay will not therefore serve as a differential test in these cases (Bender, quoted by Swyer, 1949; de Watteville, 1951).

In *chorion epithelioma* the output of C.G. increases to still higher levels, the daily excretion reaching the order of millions of international units.

Abortion

It was claimed by Guterman (1946) that by the use of his semiquantitative test for pregnanediol the fate of cases of threatened abortion was correctly predicted in 93% of 73 cases, a "positive" test being correlated with continuation of the pregnancy. Other workers have not found so close a correlation, though there is no doubt that the mean excretion for those cases in which the pregnancy continues is significantly higher than in those in which abortion occurs (Swyer, 1949; de Watteville, 1951). It is, of course, clear that some patients will abort even though the pregnanediol excretion is normal, because some cause other than pro-

gesterone deficiency is operating. Bender (1948) has produced evidence that, by using the Guterman test to differentiate cases of threatened abortion with high pregnanediol excretion from those with low outputs, and reserving treatment with progesterone for the latter only, a statistically significant increase in the salvage rate can be obtained; on the other hand, progesterone given to patients with threatened abortion but with positive Guterman tests increased the likelihood of abortion.

The pregnanediol excretion in the early months of pregnancy in patients who have had two or more consecutive early abortions does not differ significantly from randomly selected antenatal patients at comparable stages of pregnancy (Swyer, unpublished observations). This evidence therefore does not lend support to the view that deficiency of progesterone may be a cause of so-called habitual abortion. Further discussion of this problem would be out of place here.

The serum histaminase level is usually low in threatened abortion (Kapeller-Adler, 1951). It seems that the serum precipitable iodine may also be low in threatened abortion; thus Peters, Man, and Heinemann (1948) found that in 8 of 12 S.P.I. determinations in such cases the value was less than 6.2 μ g., the lowest amount found in normal pregnancy. None of these patients, it should be noted, showed any stigmata of hypothyroidism.

In *incomplete abortion* it is not uncommon to find fluctuating pregnanediol levels in serial determinations, while pregnancy diagnosis tests depending upon the detection of C.G., such as the Friedman test, may give irregularly positive and negative results. This is due to the survival of portions of placenta. In *missed abortion*, however, where placental separation is usually complete, consistently negative results are the rule.

In *multiple pregnancy* the excretion of C.G. and the serum histaminase levels are usually high, but these estimations are not of diagnostic value.

The diagnosis of *ectopic pregnancy* is often difficult, and assistance is usually sought from a pregnancy diagnosis test. The value of a rapid test, especially in cases of suspected ruptured ectopic pregnancy, needs no comment. In practice, however, all tests may prove misleading because the abnormal implantation usually results in a deficient production both of C.G. and of progesterone. Consequently, the Friedman and Aschheim-Zondek tests may be negative and the pregnanediol excretion too low to allow of the confident diagnosis of pregnancy.

So far as other commonly encountered complications of pregnancy are concerned, studies of the hormone levels have not been sufficient to permit any generalizations. It is obvious, therefore, that much work on this subject remains to be done, and the time is still a long way off when the clinical pathologist, working in a routine laboratory, can hope to be able to give the perplexed obstetrician much assistance by means of hormone assays.

Summary

The list of hormones of actual or potential interest in pregnancy is a formidable one, and assay methods for several of them are still imperfect. In normal pregnancies the oestriol fraction and, to a lesser extent, the oestrone and oestradiol fractions show marked increases during the last two trimesters, but fall rapidly during the last fortnight; progesterone production, as judged by pregnanediol excretion, follows a somewhat similar pattern; chorionic gonadotrophin secretion begins as soon as implantation of the ovum has been established, rises to a striking peak between the 60th and 80th days, and then falls to a more or less steady level; complex changes occur in the adrenocortical metabolites, the precise nature and significance of which are but little understood; ill-defined and uncertain changes occur in the

various pituitary hormones; and the histaminase and pitocinase contents of the plasma rise in characteristic fashions.

In abnormal pregnancies comparatively few hormone studies have been made except in toxæmia and abortion. In the former it seems that most, but not all, cases show an increase in chorionic gonadotrophin and a decrease in oestrogens and pregnanediol; probably the adrenal corticoids are also increased, though the 17-ketosteroids are decreased. In threatened abortion there is usually, but certainly not always, a low pregnanediol excretion and a low serum precipitable iodine (representing circulating thyroid hormone) and histaminase content. The chorionic gonadotrophin is greatly increased in hydatidiform mole and in chorion epithelioma. Less well-defined hormone changes may be found in various other abnormalities of pregnancy.

The international conference on blood transfusion, recently held at the British Standards Institution in London, reached agreement on several fundamental proposals, the objectives of which are to get standardization and interchangeability of the equipment involved both in obtaining blood from donors and in giving transfusion to patients. Among the proposals agreed, and which it is expected will be the subject of International Organization for Standardization recommendations for national standards, are such important items as: overall sizes of glass containers, including sizes of the necks of the bottles; properties to be possessed by the stoppers of the bottles; the dimensions of the mounts for flexible tubing and piercing needles; identification of the piercing positions in the stoppers separately for collecting and for transfusion of blood; minimum rate of filter and drip chamber flow. Items for future study include: standard sizes of the most used bottle; type of mount for hypodermic needle; simple label identification of the blood group of the contents of the bottle; and performance standards for the glass bottles.

CHANGES IN BASAL METABOLISM, SERUM-PROTEIN-BOUND IODINE, AND CHOLESTEROL DURING TREATMENT OF HYPOTHYROIDISM WITH ORAL THYROID AND L-THYROXINE SODIUM

BY

J. DOUGLAS ROBERTSON, M.D., D.Sc., F.R.C.P.
F.R.I.C., D.P.H.

Director

AND

H. F. W. KIRKPATRICK, Ph.D., B.Sc., F.R.I.C.

Chemical Pathologist

Department of Clinical Investigation, the London Clinic

It has been generally established that in patients with untreated hypothyroidism the serum-protein-bound iodine (P.B.I.) is consistently below the normal range of 4 to 8 µg. per 100 ml., and the literature has been reviewed by Rapport and Curtis (1950). Further, Winkler, Riggs, and Man (1945) claimed that serum iodine is not only a valuable aid in the diagnosis of hypothyroidism but a useful criterion of the adequacy of treatment with thyroid substance, for its return to within the normal range with adequate treatment is a better indication of the thyroid status of the patient than the basal metabolic rate (B.M.R.), the latter becoming stabilized at a slower rate than the serum iodine.

In support of this statement Winkler *et al.* described their findings, first, in a case of post-operative hypothyroidism, after thyroidectomy for thyrotoxicosis: "Forty days after operation the serum iodine had already fallen to 1 µg. per 100 ml., yet the metabolic rate was still +3%; and, secondly, their observations in controlled hypothyroidism after withholding thyroid: "Indeed, in the entire series of patients at the time of the initial iodine determination, metabolic rates as low as -30% or less need not appear unless the patient had remained untreated for several years." They also quoted the case of a patient with hypothyroidism whose initial (untreated) B.M.R. was -34, and who after more than a year of adequate thyroid therapy maintained a normal B.M.R. of -6, despite a period of over eight months without thyroid, and a serum iodine of 2.6 µg. per 100 ml. It has also been stated that the latter is less subject than the B.M.R. to fluctuations in serial determination (Riggs, 1947). Hypercholesterolaemia is usually another characteristic feature of hypothyroidism, but it is not apparently an obligatory accompaniment (Winkler, Riggs, and Man, 1945).

The treatment of hypothyroidism with synthetic thyroxine has been described by Hart and MacLagan (1950), who conclude that L-thyroxine sodium is as satisfactory for the purpose as thyroid extract, and suggest that it has an advantage in reliability in that it is a synthetic substance and requires no biological or chemical standardization.

In order to compare the results of treatment of hypothyroidism with L-thyroxine sodium and with whole dried thyroid we have made serial examinations of five established cases. The patients voluntarily agreed to stop treatment for a period of some two months, after

which time the B.M.R., P.B.I., and serum cholesterol were determined while these substances were given for alternating periods.

Methods

The B.M.R. was measured by the closed-circuit method, evidence of the accuracy of which was given by Robertson (1937). The apparatus used was the Benedict-Roth with recording kymograph. All machines were alcohol-checked (Barrett and Robertson, 1937) and found to be accurate; in addition each was checked once a week by a model whose B.M.R. was in the region of 54 calories an hour. The standard technique used in measuring the B.M.R. has been described by Robertson (1944). The subjects attended on at least two successive mornings, and were seen personally by one of us. If on the second day the duplicates agreed within 5% (and were not higher than the first-day readings) the lower reading was taken as the B.M.R. On the other hand, if the duplicate readings were not within 5%, or the second-day readings were higher than those on the first day, then readings were taken on subsequent days until a constant reading was obtained.

In the present series, excluding the initial readings, basal rates were obtained in two days. As the technique for measuring the basal metabolism varies in different laboratories (DuBois, 1936), it is important, particularly when comparing the B.M.R. with the serum iodine, to describe precisely the technique employed and the chemical procedure adopted in estimating the blood iodine. The P.B.I. was determined by the method of Barker (1948) as modified by Barker and Lipner (1949), with some modifications which will be discussed elsewhere (Kirkpatrick—unpublished).

Cholesterol was estimated by the method of Sackett (1925). Medication was given orally in the form of tablets—L-thyroxine sodium (Glaxo), 0.1 mg., or thyroid B.P., 1 gr. (65 mg.) (Armour)—also gelatin-coated tablets of a thyroid preparation stated to be of B.P. specification.

Results

The detailed results of our investigations are conveniently shown in Figs. 1-5. In each case, after a period on L-thyroxine sodium with increasing dosage, thyroid was substituted in the form of gelatin-coated tablets. The net result was a general return to a near myxoedematous condition regardless of dose. Upon investigating the disintegration characteristics of these tablets it was found that only a small indefinite proportion disintegrated at all under physiological conditions, and the results have been disregarded except in the qualitative sense of confirming a lag in the response of the B.M.R. to a change of thyroid status, and in disclosing the hazard of using tablets not of B.P. specification.

The following changes have been noted from a study of the charts.

P.B.I.—A rapid rise occurs at the initiation of treatment, and the level rises or falls with variations in dosage, being stabilized within two weeks on a fixed dose irrespective of whether thyroxine or thyroid is being administered. Cessation of treatment in each case reduced the level of the P.B.I. to well below the range of our normal controls—namely, 3.6 to 8.6 $\mu\text{g. per } 100 \text{ ml.}$

FIG. 1.—Observations on Case 1.

FIG. 2.—Observations on Case 2.

FIG. 3.—Observations on Case 3.

FIG. 4.—Observations on Case 4.

FIG. 5.—Observations on Case 5.

B.M.R.—There is a distinct lag in the response of the B.M.R. both to initiation of treatment and to changes in the latter which involve a significant change in the P.B.I. This lag may take the form of a steady decrease or increase until stabilization occurs, or it may even result in no change in the B.M.R. during the first two weeks. Stabilization of the B.M.R. is not complete until four weeks have elapsed on a fixed dosage.

Cholesterol.—In each of our five cases hypercholesterolaemia was present coincident with myxoedema. During treatment the cholesterol level gave a fair indication of the thyroid status, though the changes incline to sluggishness compared with the P.B.I., and some rather inexplicable changes seem liable to occur.

Calculations from our results have been made of the direct relationships between the P.B.I., B.M.R., and doses of thyroxine or thyroid, and the findings are summarized below.

Relation Between the P.B.I. and Dose of Thyroxine or Thyroid (Tables I and II).—The calculation has been made by dividing the observed rise in P.B.I. in $\mu\text{g. per 100 ml.}$ from the basic untreated level by the dose.

Relation Between the B.M.R. and Dose of Thyroxine or Thyroid (Tables III and IV).—In correlating the B.M.R. with the dose of medicant, it is obviously necessary to allow enough time for stabilization of the former. We have accordingly employed only those figures that were obtained

after four weeks at the set dosage. Calculation was made by dividing the rise from the basic untreated level by the dose.

Relation Between the P.B.I. and B.M.R. (Table V).—This relationship was calculated by dividing the rise in B.M.R. from the untreated basic level to a stabilized value by the corresponding rise in P.B.I. from the untreated basic level.

TABLE I.—Rise in P.B.I. ($\mu\text{g. per 100 ml.}$) per 0.1 mg. L-thyroxine Sodium

Patient	1	2	3	4	5

Mean of all results = 5.0. Standard deviation, ± 0.77 .

Table VI shows the decline in the B.M.R. after treatment with thyroid was discontinued. Symptoms of hypothyroidism were complained of after three weeks and signs were apparent by the fifth week. By five to eight weeks after thyroid had been discontinued the B.M.R. had practically fallen to the initial level when the patient was first seen and before any treatment had been instituted. The serum iodine also decreased after thyroid had been stopped.

Discussion

When thyroid was withheld from cases of hypothyroidism the B.M.R. fell and in five to eight weeks reached the low level found before treatment. There was a parallel fall in the serum iodine over the same period. These observations do not agree with those reported by Winkler, Riggs, and Man (1945), who stated that the decrease in serum iodine "may take place weeks or months before there is any marked change in the basal metabolism." The decline in the B.M.R. to an athyreotic level, as we have reported after withholding thyroid for five to eight weeks in cases of treated hypothyroidism, would be expected from the work of Boothby and his co-workers (1924, 1925) on the calorogenic properties of a single injection of thyroxine in cases of hypothyroidism, when they found that the thyroxine was destroyed or eliminated in about fifty days.

Some confusion may be caused by the following statement in Winkler, Riggs, and Man's paper (1945): "In the entire series of patients at the time of the initial iodine determinations metabolic rates of -30 or lower need not appear for several years." By analogy this might be understood to imply that these authors regarded a B.M.R. of at least -30 as a prerequisite for the diagnosis of untreated hypothyroidism. In thyrotoxicosis there is no absolute basal rate figure for confirming the diagnosis because, although the B.M.R. may be well above +50 in severe cases, in mild cases it may lie within the normal range (Robertson, 1934), and such findings in reverse could equally well apply to cases of hypothyroidism. Means (1948) has stated that in complete athyreosis the B.M.R. runs very constantly in most cases between -35 and -45, and here the clear-cut picture of myxoedema is present; but in lesser degrees of hypothyroidism correspondingly higher basal rates will be obtained, and these may even border on the lower limits of the normal range.

The specific action of iodine on the B.M.R. in thyrotoxicosis has been employed as a delicate and exact diagnostic aid in that condition when the degree of toxicity is mild and clinically the picture is difficult to assess (Means, 1933; Robertson, 1934); and Robertson (1949) has suggested that the effect of thyroid, 2 gr. (130 mg.) daily, on the B.M.R. was of equal use in diagnosing mild hypothyroidism. To fix a B.M.R. of -35 with an average of about -40 (Means, 1948) as an arbitrary limit above which clear-cut myxoedema or complete athyreosis can be ruled out is now generally accepted, but rates higher than this need not exclude milder degrees of hypothyroidism. In addition to this being a personal experience, a study of Winkler, Riggs, and Man's cases (1945) shows that 13 out of 18 untreated cases of hypothyroidism had an initial B.M.R. higher than -35, and three were as high as -18 to -19. It is difficult to explain, as described by the above authors, a B.M.R. of -6 after stopping thyroid, 1½ gr. (100 mg.), for over eight months in a case with an initial B.M.R. of -34. No such phenomenon has been noted in a series of 16 cases of established myxoedema with a mean initial B.M.R. of -40 (range -34 to -47). In all cases the B.M.R. fell from normal to the initial level within two months of stopping thyroid (Robertson, unpublished results).

Our general observations on the changes in the B.M.R. and P.B.I. during treatment of hypothyroidism are in substantial agreement with those of Winkler, Riggs, and Man (1945), in that there is a rapid stabilization of the P.B.I. during treatment compared with a lag in the response of the B.M.R. Our calculations correlating the changes in the B.M.R. with those in the P.B.I., and the changes in the P.B.I. and B.M.R. with the dose of thyroxine or thyroid, have been confined to the simplest terms, but the inferences to be drawn from the results appear to us to be quite clear-cut. Tables I and II indicate that the variation in the response of the P.B.I. to thyroid is twice as great as that to L-thyroxine sodium. Tables III and IV show the response of the B.M.R. to thyroid to be about two and a half times as variable as that to L-thyroxine sodium. In contrast to these observations Table V shows that correlation of the B.M.R. with

P.B.I. is of the same order irrespective of whether thyroid or L-thyroxine is administered. It therefore seems obvious that a large part of the variation encountered in the use of thyroid for the control of hypothyroidism can be attributed to deviations in the biological potency of the thyroid, and that this particular variation can be avoided by administration of L-thyroxine sodium.

The lag in the B.M.R. behind the P.B.I. led Winkler, Riggs, and Man (1945) to state that fluctuation in P.B.I. in hypothyroidism was a more useful criterion than the B.M.R. of the adequacy of treatment with thyroid. Our results do not support this view. Next to the clinical picture we feel that the B.M.R. gives a better index of the patient's thyroid requirements than the P.B.I., for on several occasions during thyroid and thyroxine medication the P.B.I. reached levels commonly found in thyrotoxicosis (above 8 µg. per 100 ml.) when in fact clinically there was no evidence of overdosage and the B.M.R. was within the normal range.

Summary and Conclusions

Five cases of hypothyroidism have been treated orally with L-thyroxine sodium and two brands of thyroid over periods of six to eighteen months.

Clinically, L-thyroxine sodium is as satisfactory as thyroid gland in the treatment of hypothyroidism.

Relationships between the B.M.R., serum iodine, and doses of thyroid and L-thyroxine sodium observed during treatment of five cases of hypothyroidism indicate a less variable response to thyroxine than to thyroid. Treatment with L-thyroxine sodium results in an average rise of 1.9 µg. per 100 ml. in the protein-bound iodine (P.B.I.) and 7% in the B.M.R. per 0.1-mg. dose.

Stabilization of the P.B.I. occurs more rapidly than that of the B.M.R. during treatment with either L-thyroxine sodium or thyroid. Next to the clinical picture the B.M.R. gives a better index of the patient's thyroid or thyroxine requirements than the P.B.I., for on several occasions during therapy the P.B.I. reached levels commonly found in thyrotoxicosis (above 8 µg. per 100 ml.) when clinically there was no evidence of overdosage and the B.M.R. was within the normal range. The P.B.I. tended to reach higher values with thyroxine than with equivalent doses of thyroid.

Our results, although on a small series of patients, do not support the statement of Means (1948) that the maintenance ration of thyroid is remarkably similar from patient to patient. In our series, dosages of from 0.2 to 0.5 mg. of thyroxine daily, or approximately 2 to 5 gr. (130 to 325 mg.) of thyroid daily, were required to keep the patients symptom-free.

Winkler, Riggs, and Man's statement (1945) that patients are unable to tolerate more than 3 gr. (200 mg.) of thyroid daily without developing symptoms of overdosage is also not supported. The restoration of a P.B.I. to a normal level of 6 µg. per 100 ml. as suggested by these authors was found to be no guide to assessing the maintenance dose of thyroid; for, in our series, patients were symptom-free and without any evidence of thyroid excess at P.B.I. levels all in excess of 6 µg. per 100 ml.

Some disparity in the results can no doubt be attributed to the different methods of standardizing thyroid B.P. and thyroid U.S.P. The former is assayed for thyroxine iodine and the latter for total iodine, the standards being 0.1% and 0.2% respectively, so that unless the ratio of thyroxine iodine to total iodine has a constant value of 1:2, there must obviously be a difference in biological activity.

- The serum cholesterol affords an approximate indication of thyroid status, but seems liable to unaccountable fluctuations.

It is a pleasure to thank Mr. A. V. Bridgland, Chairman of the Trustees of the London Clinic, for granting facilities for this investigation. The thyroxine derivative used was generously supplied by Glaxo Laboratories Ltd.

ADDENDUM.—Subsequent to the completion and submission for publication of this paper, further proof of one of our conclusions has been rather strikingly afforded. One of the patients (No. 3) was referred to us for re-examination by her local doctor one year after stabilization on L-thyroxine sodium, 0.5 mg. daily, with the opinion that, clinically, she appeared in need of a higher dosage of thyroxine. Our examination showed her B.M.R. to be well within the normal range (−3), whereas her serum P.B.I. was 13.5 µg.%, a distinctly thyrotoxic level. It seems obvious, therefore, that during treatment of hypothyroidism with thyroxine the serum P.B.I. may reach a high level indicative of thyrotoxicosis when no such condition is present clinically, and that a more accurate indication of clinical status is provided by the B.M.R.

A PERSISTENT URINARY SALMONELLA DUBLIN CARRIER WITH BILHARZIASIS

BY

W. SLOAN MILLER, M.B., Ch.B.

Surgeon Commander, R.N.; Head, Department of Bacteriology, United States Naval Medical Research Unit No. 3, Cairo, Egypt

Attention has recently been drawn to the prevalence in Egypt of urinary typhoid and paratyphoid carriers (Morton, 1949; Neva, 1949; Walton, 1949; Archer *et al.*, 1950). Their importance to the public health is attested by the fact that at least one large outbreak of typhoid among British Service men in the Suez Canal zone has been attributed to an Egyptian urinary excretor of typhoid bacilli (Anderson and Richards, 1948).

In a collaborative study with Dr. J. Weir, representative in Egypt of the Rockefeller Foundation, 53 native urinary salmonella carriers have been followed up for over a year. The distribution of these carriers by salmonella types, when they were originally detected, was as follows: 28 *Salm. typhi*, 13 *Salm. paratyphi A*, 2 *Salm. paratyphi B*, 9 *Salm. paratyphi C* (or group C), and 1 *Salm. dublin*. Some of the temporary carriers later acquired a urinary or faecal species of salmonella different from the original infection.

That the series should contain a carrier who has continued to excrete *Salm. dublin* in his urine for over a year seems worthy of record, because this organism is a common cause of disease in man and animals in many parts of the world, but does not appear to have been isolated in Egypt before. Cattle are apparently the main reservoir of infection and the usual source of the human disease, but the present case indicates that the human carrier may play a more important part in the dissemination of *Salm. dublin* infection than has hitherto been thought.

Case Report

This man, an agricultural labourer aged about 35, was found in a bacteriological survey of the general population of a Nile Delta village, where the urinary enteric carrier rate among men, women, and children was 3% (Miller, 1949). He is physically fit, and his only admitted incapacitating illness was one month's "fever" about 10 years previously. He had been passing blood in his urine for 15 to 20 years, but this did not trouble him and he had never sought treatment for schistosomiasis. His youngest child died of "enteritis" at the age of 1 year, but there was no other history of serious family illness. All of 18 specimens of urine examined at more or less regular intervals from November, 1949, until March, 1951, produced a heavy growth of a non-lactose fermenting organism when plated directly on Difco SS agar.

The Organism.—All isolates were actively motile Gram-negative bacilli which fermented glucose, mannite, and dulcitol with the production of gas, and caused no change in lactose, sucrose, or salicin. They produced abundant hydrogen sulphide but were indole- and urea-negative and did not liquefy gelatin. They agglutinated strongly in salmonella O serum of group A, to a lesser extent in sera of groups B and D, and not at all in serum of group C; but formalinized broth cultures failed to agglutinate in any of the enteric group diagnostic H sera available in this laboratory. A culture was sent to Commander L. A. Barnes, of the Naval Medical Research Institute, Bethesda, Maryland, U.S.A., who identified the organism as *Salm. dublin*.

Eggs of *Schistosoma haematobium* were found in 16 of the 18 urine specimens, blood in 15, and macroscopic pus in every one. No salmonella or shigella organisms were cultured from 13 stool specimens examined at approximately monthly intervals.

Ten specimens of the carrier's blood were collected during the course of a year. The clots were cultured by a technique known to give a very high proportion of positive results in cases of enteric fever, but all were sterile. The serum specimens were used for agglutination tests. No H agglutinins for typhoid or paratyphoid A were detected; but low-titre (1:5–1:20) H-specific agglutinins for paratyphoid B and C were present in some of the specimens. The typhoid O titre fluctuated between 1:40 and 1:320, and the Vi titre from traces of agglutination at 1:5 or 1:10 dilutions to full standard agglutination at 1:20. The patient's serum invariably agglutinated formalinized broth cultures of his own organism at dilutions varying from 1:640 to 1:2,560.

Comment

The geographical and zoological distribution of the different salmonella species is of considerable interest and practical importance, because all seem to be potentially pathogenic for man. Although *Salm. dublin* has been isolated from many different animals, it appears to be particularly common in cattle and foxes, being at times the cause of epizootics in their young, with a high mortality leading to serious economic loss. It has been reported as a predominant salmonella type of cattle in Britain, Holland, Finland, Sweden, Australia, South Africa, and South

America; and of foxes in Denmark, Finland, Norway, Holland, and the far west of the United States of America (for references to the literature, see Wilson and Miles, 1946). The apparent absence of this particular salmonella from the extensive eastern and mid-western parts of the United States is quite remarkable (Edwards *et al.*, 1948).

Raw milk from an infected cow is the usual vehicle for human *Salm. dublin* infections, and large outbreaks of food-poisoning from this source have often been reported. Symptoms of the infection vary from a mild gastro-enteritis to a fulminating septicaemia, with a special predilection for fatal meningeal involvement in young children. In Britain *Salm. dublin* has been found more invasive for humans than the other food-poisoning salmonellae (Report of Ministry of Health, 1950). The present carrier had no access to cow's milk, but at the time when he had his bout of fever he was part owner of a water buffalo and customarily drank its milk raw. Since *Salm. enteritidis* (Gaertner) infection of water buffaloes had been described (Wolff, 1930) before this closely related organism was generally differentiated from *Salm. dublin*, they may well be natural hosts, as cattle are, and the patient's febrile episode was perhaps a *Salm. dublin* infection resembling enteric fever, conveyed by buffalo milk, followed by the chronic carrier-state. This man's unhygienic family environment emphasizes the possibility that his infant's death at weaning age was due to a *Salm. dublin* infection conveyed from the father.

Chronic human carriers of salmonellae other than typhoid and paratyphoid are relatively uncommon, and those that have been reported were almost invariably faecal. I have failed to find any other chronic human carrier of *Salm. dublin* described in the literature. Ledingham and Arkwright (1912), however, mention two cases of chronic urinary infection with *B. enteritidis* Gaertner, which at that time was indistinguishable from *Salm. dublin*.

ADDENDUM (January 15, 1952).—This man continued to be a profuse urinary excreter of *Salm. dublin* until September, 1951, when he was given 30 g. of chloramphenicol in the course of 10 days. In 100 post-treatment days all of 31 urine and 14 stool specimens have been negative for salmonella organisms, despite uncured urinary bilharziasis.

Grateful acknowledgment is made to Dr. I. Messak, of the Egyptian Public Health Service and Rockefeller Foundation, for invaluable assistance in the collection of specimens and in language interpretation; to J. D. Gilmore, J. E. Samsell, and J. R. Baranski for technical assistance; to Captain J. J. Saper, U.S.N., Commanding Officer of this Unit, for helpful advice; and to the Medical Director-General of the Navy for permission to publish.

The Archbishop of Canterbury said at a meeting of the Society for the Promotion of Christian Knowledge in London recently that the rising costs of printing meant that very soon we should become a nation of illiterate people (*Manchester Guardian*, March 7). This was not because we could not read intelligently—though he added that there were not so many who could—but because there would no longer be money left to print anything for people to read. This mounting cost was a real threat to our cultural life.

BALANTIDIASIS IN SOUTH PERSIA*

BY

A. GEDDES McCAREY, M.D., D.M.R.D., B.Sc.

Lately Medical Officer, Anglo-Iranian Oil Company,
Abadan, South Persia

Balantidiasis is a rare disease in man, and it is therefore considered that the following 87 cases found in South Persia between April 1 and December 31, 1948, are worth placing on record. The only previous records of balantidiasis in Persia are by Stshensnovitsh (1943) and Selimkhanov (1947).

Local Conditions

The cases occurred among the population of Abadan, an oil refinery town on the island of Abadan, South Persia. This island is situated in the estuary of the Shatt-el-Arab river, at the head of the Persian Gulf, and is some 30 miles (48 km.) long and 5 miles (8 km.) wide at its broadest part. It is a flat desert, with small areas under cultivation. The temperature in winter seldom falls below freezing-point, and the summer shade temperature averages 110–118° F. (43.3–47.8° C.), with usually low humidity. The winter rainfall is about 15 in. (38 cm.). Rain does not fall during the summer.

The population of the town at the time consisted of about 200,000 Persians, 2,000 Indians and Pakistanis, and 5,000 British. About 100,000 of the Persians were either employed in the refinery operated by the Anglo-Iranian Oil Company or were dependants of employees. Much was done by the oil company to control and prevent the spread of disease by providing public lavatories and baths, clean piped water supply, an efficient sewerage system, and collection and disposal of refuse. It was sometimes difficult, however, to persuade the uneducated section of the populace to use these facilities, or to make them realize the value of simple hygiene.

In an effort to reduce the incidence of the dysenteries in Abadan a scheme was instituted on April 1, 1947, by which all artisan employees reporting sick and regarded as cases of dysentery on clinical grounds or from stool examination were admitted to the company's isolation hospital. Any employee found to be a carrier of dysentery was also admitted. This scheme was described by Stewart (1949), and led to the collection of this series.

An excellent account of the pathology, with necropsy reports, and a review of the literature on balantidiasis, is given by Koppisch and Wilking (1947).

Mode of Infection

All patients in this series were Mohammedans. In accordance with their religion they had no contact with pigs, nor did they eat pork. The pig can be excluded as the source of infection. This is in accordance with the conclusion reached by Ostroumov (1947) following examination of pigs and slaughterhouse workers in Soviet Central Asia.

No cysts were found in the stools in the Abadan series, and no source of infection, apart from the human cases, was discovered. Intestinal contents of sheep and cattle killed in the town slaughterhouse were examined, but no balantidia were found. The excreta of goats and samples of river water revealed no balantidia. After this investigation, which ended on December 31, 1948, cases occurred with much less frequency, but all continued to be admitted to hospital for treatment. Dr. I. S. Stewart later informed me in a personal communication that balantidiasis is now rare. A man-to-man transmission of the infection therefore seems to be strongly suggested.

*This paper is condensed from a thesis presented for the M.D. degree of the University of Glasgow, 1950.

Method of Investigation

The geographical location of the patient and any contact with animals over the two years prior to admission to hospital were investigated. Neither of these factors was found to be significant. A history of previous attacks of diarrhoea and of the present attack was taken. A history of previous diarrhoea was found in 65% of cases.

A routine physical examination, inspection of the lower 7 in. (17.8 cm.) of bowel by sigmoidoscopy, macroscopic and microscopical stool examinations, and stool culture were made. Each case was re-examined after six months, and if the stool was positive had further treatment and was followed up.

Clinical Features

Common complaints were diarrhoea, abdominal pain, tenesmus, and the passage of blood and mucus. In uncomplicated cases the symptoms in general were mild, though 22% had severe pain and diarrhoea with much blood and mucus. Seven cases which had concomitant bacillary dysentery and one with concomitant amoebic dysentery had severe symptoms.

Small discrete ulcers were found in the lower bowel in 11 cases. Scrapings of these ulcers invariably revealed the presence of numerous balantidia. These ulcers healed in each case after successful treatment of the infection. Physical examination commonly revealed tenderness and patchy thickening of the colon. No death occurred in the series.

Treatment

Until it became evident that acetarsol ("stovarsol") was a specific treatment, other drugs were given a trial. Two cases were admitted to hospital with positive stool reports, but no balantidia were found after admission, and no treatment was given.

Sulphaguanidine.—A daily dose of 20 g. was given to seven cases of uncomplicated balantidiasis. Three cases received a total of 20 g. each, one case 40 g., one 60 g., one 80 g., and one 100 g.

Mepacrine.—As mepacrine had proved successful in the treatment of giardiasis, it was given a trial. Five cases were each given 0.1 g. thrice daily. One case in this group had previously received sulphaguanidine, 80 g.

Mercury Binioidide.—In view of Shun-Shin's (1947) success with mercury binioidide, five cases were given two intramuscular injections of $\frac{1}{2}$ gr. (32 mg.) with an interval of two days between injections.

Acetarsol.—Eleven cases were given 4 gr. (0.26 g.) thrice daily for five days, a total of 60 gr. (4 g.). Fifty cases were given 4 gr. (0.26 g.) thrice daily, until the stools became negative, when treatment was stopped. Of these 50 cases, 3 had one day's treatment—12 gr. (0.8 g.), 11 had two days' treatment—24 gr. (1.6 g.), 27 had three days' treatment—36 gr. (2.4 g.), and 9 had four days' treatment—48 gr. (3.2 g.). Twenty cases which were positive at the follow-up or had relapsed within six months were also treated with acetarsol until the stools became negative. Six cases had two days' treatment—24 gr. (1.6 g.), 11 had three days' treatment—36 gr. (2.4 g.), and 3 had four days' treatment—48 gr. (3.2 g.) (see Table II).

TABLE I

No. of Cases Treated	Drug Used	Daily Dose	Days of Treatment	Method of Administration
7*	Sulphaguanidine	20 g.	1-5	Oral
5*	Mepacrine	0.3 g.	5	"
5*	Mercury binioidide	$\frac{1}{2}$ gr. (32 mg.)	2	I.M. injection
11	Acetarsol	12 gr. (0.8 g.)	5	Oral
50 plus 20 followed up	"	12 gr. (0.8 g.)	1-4	"

Two cases had no treatment.

* Some of these cases were treated with two different drugs.

Thirteen further cases were treated with acetarsol, but as these men left the employ of the company, or were non-employees and could not be traced, they are excluded from further mention in this series. The treatment is summarized in Table I.

Table II summarizes the number of days of treatment and the quantity of acetarsol administered before the stools became negative in the last 50 cases of the series and in those cases which were positive at the follow-up or which relapsed.

TABLE II

No. of Cases	Days of Treatment	Amount of Acetarsol
3	1	gr. 12 0.8
17	2	24 1.6
38	3	36 2.4
12	4	48 3.2

Average no. of days of treatment = 2.84.

Average quantity of acetarsol given = 34.1 gr. (2.3 g.).

Immediate Response to Treatment

Of the seven cases treated with sulphaguanidine, the stools became negative in four, and remained positive in three. In no case treated with mepacrine or with mercury binioidide did the stools become negative. One case with concomitant amoebic dysentery received 10 intramuscular injections of emetine hydrochloride, 1 gr. (0.65 mg.), but *Balantidium coli* persisted in the stools.

Acetarsol was given to the 61 original cases, to the two that relapsed within six months, and to the 18 that were positive at the follow-up. No case failed to respond to this treatment, the stools becoming negative in every case. In two untreated cases the stools spontaneously became negative.

Result of Follow-up

One of the two untreated cases had a positive stool at the follow-up six months later. Acetarsol was given until the stools became negative, and six months later they were still negative. Sulphaguanidine, mepacrine, or mercury binioidide, or a combination of these drugs, was used in the treatment of 17 cases. All these had a positive stool at the follow-up after six months, and all were negative six months later, after treatment with acetarsol.

Of the 61 cases treated with acetarsol at the outset, two relapsed, one in a month and the other in two months, four had a positive stool on follow-up, and 55 a negative stool. The two relapses and the four which were positive at the follow-up were treated again with acetarsol, and all had a negative stool six months later.

All cases in the series were permanently cured by acetarsol, although two treatments were required in six cases. Table III summarizes the immediate response to treatment and the result of the follow-up.

TABLE III

No. of Cases	Treatment Given	Immediate Result of Treatment		Relapses	Follow-up	
		Stool Pos.	Stool Neg.		Stool Pos.	Stool Neg.
2	None	—	2	?	1	1
7	Sulphaguanidine	3	4	—	7	—
5	Mepacrine	5	—	—	5	—
5	Mercury binioidide	5	—	—	5	—
61	Acetarsol	—	61	2	4	55

Discussion

The pathology of balantidiasis has been thoroughly investigated by several workers (Walker, 1913; Strong, 1942; Koppisch and Wilking, 1947). There is no divergence of opinion on the type of lesion produced or the

degree of severity these lesions may attain. The two main problems of balantidiasis remain to be solved: first, its mode of spread, and, secondly, its treatment.

Opinion is divided on whether or not the pig plays any part in the spread of human balantidiasis. Walker (1913) is of opinion that pigs serve as a reservoir for human infection, and Craig and Faust (1940) state that 25% of cases give a history of contact with pigs. Neither, however, produces evidence of the transfer of the infection from a pig to man. The evidence to support the theory of infection being contracted from pigs is therefore only presumptive. Ostroumov (1947), after studies of abattoir workers, states that he is convinced that the pig plays no part in the epidemiology of human balantidiasis. Ferri (1943), from observations on a group of children in a mental hospital in Tomsk, concluded that the infection was passed from child to child. In my series of cases it is certain that pigs played no part in the transmission of the disease. It may therefore be concluded that balantidiasis may be contracted from pigs, but it is certain that the disease can be transmitted without the pig acting as an intermediate host.

In the group of children studied by Ferri no cysts were seen. Neither in my series were any cysts seen in numerous stool examinations in each of 87 cases. It therefore seems a logical conclusion that transmission can occur in the active ciliate state, although the generally accepted theory is that infection occurs by swallowing cysts.

The first experiment to produce human balantidiasis was carried out in 1896. Andrews (1930) cites Cassagrandi and Barnagallo as having in that year fed balantidia from man and pigs to human volunteers, but they failed to infect them. Ziemann, in 1925, again cited by Andrews, fed balantidia from chimpanzees to men, but also failed to infect them. In view of the number of different species of *Balantidium* described since these early experiments, however, we cannot be sure that it was *Balantidium coli* which was actually used. Knowles and Das Gupta (1934) fed trophozoites and cysts of balantidia from the monkey *Macacus rhesus* to two men. Neither developed balantidiasis. However, it is now known that the rhesus monkey is infected by *Balantidium simile*, which is not pathogenic to man, and balantidiasis would not therefore develop. Young (1950) fed cysts and vegetative *Balantidium coli* in gelatin capsules to two volunteers. Over a period of 10 years neither developed diarrhoea or passed cysts or trophozoites in the stools. The ciliates given were obtained from a human case of balantidiasis. No intermediate host was found in my series, and the mode of transmission of balantidiasis must remain open to debate.

Sweeney (1929) carried out experiments on guinea-pigs with balantidiasis in an endeavour to find a suitable drug for treatment. Of many substances tried, she found the arsenicals gave the best results, and more particularly acetarsol, tryparsamide, and "parosan." These drugs do not seem to have been used much in the treatment of human balantidiasis. Only one reference to the use of acetarsol was found (Atiles, 1943). Results in my series would indicate acetarsol to be of definite value. No success was obtained with mercury binitiodide, as used by Shun-Shin (1947) and Pramanik (1947).

Summary and Conclusions

A series of 87 cases of balantidiasis among the workers of a large industrial concern in South Persia is described. The mode of infection is assessed, the method of the investigation outlined, and the result of treatment stated.

It is stated that pigs played no part in transmission of the disease, that man-to-man transmission is strongly suggested, and that acetarsol is an effective drug in the treatment of balantidiasis.

I should like to thank Dr. S. D. McClean, chief medical officer, Anglo-Iranian Oil Company, for permission to publish this paper, and Dr. I. S. Stewart, pathologist, Anglo-Iranian Oil Company, for much helpful criticism in its preparation.

EXCHANGE TRANSFUSION IN SEVERE ANAEMIA

BY

T. WARD, M.B., B.S.

(From the Royal Victoria Infirmary, Newcastle-upon-Tyne)

The object of this paper is to describe a technique for exchange transfusion in patients with severe anaemia. The technique has not, to my knowledge, been reported previously.

In exchange transfusion the patient's blood is exchanged for similar volumes of whole blood or packed cells. In the present method packed cells are used, and the general principle of combined exsanguination and transfusion is the same as that employed in the treatment of erythroblastosis and chronic leukaemia.

In severe prolonged anaemia, however, there is little cardiac reserve, and some cases exhibit cardiac failure with congestion. For such cases Victor Riddell (1939) suggested preliminary venesection before transfusion, but with the technique here described exsanguination and transfusion are done simultaneously.

Technique

The components of the transfusion apparatus are: (1) Packed cells; (2) giving set; (3) funnel calibrated in ml. for measuring volume of transfusion blood; (4) two lengths of 2-mm. bore polythene tubing; (5) cannula to unite giving set and polythene tubing; (6) cutting-down set; (7) measuring cylinder (1,000 ml.) calibrated in ml.; (8) heparin (5,000 units per ml.); (9) 50-ml. syringe with 3.8% sodium citrate or heparinized saline (5,000 units per litre normal saline); (10) sterile needle (for use in removing clots from tip of venous escape); (11) acriflavine-cetrimide skin preparation; (12) tourniquet. (Sterilization of polythene tubing: Farquhar and Lewis, *Lancet*, 1948, 2, 244.)

The apparatus for the transfusion is set up as shown in Fig. 1. Packed cells are run into the measuring funnel, and a little is allowed to run through the apparatus to clear it of air bubbles.

Cut-down.—A vein in the antecubital fossa is incised immediately distal to a venous valve. A transverse skin incision is made across the vein, the vein is mobilized, ligatures are passed beneath the vein, and the ends are brought out through the skin. A longitudinal incision is made into the vein. When the lumen is opened the haemorrhage is stopped by passing a haemostat beneath the vein. (The tension in the vein causes the walls to come together.)

FIG. 1.—Simple exchange transfusion.

The "polythene" tubing (2-mm. bore) is then inserted into the vein and pushed proximally for several inches. The transfusion is started at a rate of 10–15 drops a minute. The proximal ligature is tied.

Venous Escape.—A second polythene tube is washed through with 1 ml. of heparin (5,000 units) and inserted into the vein through the same incision in its wall. It is pressed distally down the vein for a few inches. Should a venous valve be encountered, it is better to withdraw the tubing a short distance, as a freer flow of blood results. The venous-escape tubing is secured with the distal ligature. Skin sutures are inserted and tied. The length of venous-escape tubing left outside the vein should be cut to about 6 or 8 in. (15 or 20 cm.). If it is longer, clotting within the tube is troublesome. The venous-escape tube is led into a measuring cylinder.

Control of Transfusion

The rate of transfusion depends on the rate of venous escape, both being measured volumetrically. The two rates should in most cases be equal. In the few cases of congestive failure needing venesection the venous escape may be allowed to exceed the volume transfused.

Venous escape should be rapid. Any tendency to slowing can be obviated by the use of a tourniquet to increase the venous pressure; palpation of the radial pulse will ensure that the tourniquet does not increase the systolic pressure. Once the rate of venous escape has been restored, the tourniquet should be released, as its prolonged application is painful.

Transfusion through polythene tubing is rarely troublesome, but clotting in the venous escape may occur. Clots form at the free end, and can be removed with a needle. A tourniquet applied distal to the proximal end of the transfusion tubing (in the vein) will increase the venous pressure and may expel such a clot. Otherwise, moving the tubing in the vein or syringing with heparinized saline (5,000 units per litre) may succeed. It is considered inadvisable to give systemic heparin, as the tendency to haemorrhage (already great in such patients) may be increased. Dicoumarol is, of course, contraindicated.

The physician in charge of the transfusion must remain at the bedside or within calling distance of the patient throughout the transfusion. A special nurse is needed for whole-time duty with the patient.

During transfusion the following are observed: (1) filling of neck veins; (2) half-hourly pulse; (3) blood pressure—hourly readings suffice; (4) drip rate and venous escape (drops/minute), half-hourly (used only as a rough check on exchange rates); (5) drip volume/unit time (half-hourly); (6) venous-escape volume/unit time (half-hourly); and (7) clinical observations.

The value of direct measurements of venous pressure during exchange transfusion has yet to be ascertained.

The following are illustrative cases. Case 1 particularly shows the need for simultaneous exsanguination.

Case 1

A man aged 59 suffering from pernicious anaemia came under our care on May 4, 1949. On admission he was very pale and very weak; he was unwilling to move, and was too ill to give a history. A blood count showed: haemoglobin, 3.4 g./100 ml. (23%); red cells, 970,000; colour index, 1.18; reticulocytes, 0.8.

FIG. 2.—Case 1. Exchange transfusion.

Replacement transfusion was started at 11.30 a.m. on May 5, using 1 mm. polythene tubing. The venous escape was troublesome. Fig. 2 shows the wide fluctuations in venous-escape rate. Nevertheless, after each reading the venous-escape rate and transfusion rates (in drops a minute) were made equal.

From the start of the transfusion until about 9 p.m. there was a progressive improvement. He lost his complete apathy, took an interest in things about him, and began to ask questions spontaneously and even to smile at times.

At 9 p.m. the venous escape blocked completely, and a slow direct transfusion was allowed to continue. There was no further improvement in his condition. Instead there was a statistically significant rise in pulse rate coincident with the blocking of the venous escape. The mean pulse rate before 9 p.m. was 74 (standard deviation 2.03); after 9 p.m. it was 86 (standard deviation 4.25). On May 6 the Hb was 6.8 g./100 ml. (46%) and red blood cells 2,480,000. Next day the Hb was 5.3 g./100 ml. (36%) and red blood cells 1,850,000. The total volume transfused was 900 ml.; the total venous escape was 630 ml.; and the duration of transfusion was 13 hours.

Case 2

A man aged 70 had suffered from symptoms of idiopathic steatorrhoea for three years, when in 1947 he developed a reticulum-cell sarcoma of the palate. Repeated recurrences of metastases in mediastinum and skin were treated successfully by radiotherapy. In July, 1949, he was admitted once more. He was very pale and weak, and had purpuric spots on his arms and legs. There was an apical systolic murmur; the pulse was feeble at 90; and the B.P. was 90/80. On July 6 a blood count showed: Hb, 3.99 g./100 ml. (27%); red cells, 1,430,000; colour index 0.91; platelets 20,000 per c.mm.

An exchange transfusion was carried out on July 7. This was the last of the present series of replacement transfusions, and is the most complete in data. Fig. 3 demonstrates the progress in the transfusion.

The blood pressure rose very gradually from 110/60 to 140/85 during the transfusion. The pulse pressure increased only by 5 mm. Hg. This is not a significant change. The pulse remained at 110 until 8.15, when the venous escape blocked. Thereafter it rose slightly to 120, reaching this rate at 9.15 p.m., when the transfusion was stopped. This rise is probably significant, but not certainly so.

The cumulative blood-drip volume and the cumulative venous escape show a marked discrepancy. (It will be noted that there were half-hourly readings of blood drip volume, but only two readings of venous-escape volume were taken.) This discrepancy was noted when the first cumulative venous escape reading was taken. The blood-drip rates and venous-escape rates in drops a minute before the first cumulative venous-escape reading had not given any indication of an inequality.

At the outset the patient was very pale and his respirations were quick and sighing. He preferred to be supported on a back rest. He was very weak. His colour improved quite soon after the transfusion was begun. His breathing became easy and unhurried by 4.45 p.m., but he remained very weak. There was never any congestion of the neck veins. The total volume transfused was 1,020 ml., the total venous escape was 1,080 ml.; and the duration was seven hours. On July 8 a blood count showed: Hb, 5 g./100 ml. (34%); red cells, 1,880,000; colour index, 0.9. In a few days he became weaker and was given a direct transfusion. His progress was relentlessly downhill. He was constipated until July 11, when melaena occurred, so it is possible that he was bleeding into the bowel at the time of his transfusion. Death occurred on July 14. At the post-mortem examination the clinical diagnoses were confirmed. There was, in addition, oedema of the left

lower lobe, but no dilatation of the atria or ventricles. A recent subdural haemorrhage and gastro-intestinal haemorrhages were present.

FIG. 3.—Case 2. Exchange transfusion.

Case 3

A frail old lady was admitted with profound pernicious anaemia. Her feet had been swollen in the evenings throughout the previous two months, though this had gone since she had been confined to bed. There was no evidence of congestive heart failure.

It was decided to carry out an exchange transfusion; 2-mm.-bore polythene tubing was used. The transfusion lasted six and a half hours, and in that time 2,300 ml. was transfused, and 2,900 ml. removed (to the nearest 100 ml.).

The pulse remained between 80 and 90 throughout the transfusion. The total amounts exchanged were large in comparison with previous cases. Throughout the transfusion, however, the patient gradually improved; she became warmer and her colour returned. She was cheerful while awake and untroubled in her sleep. She was never distressed in any way, and never showed filling of the neck veins.

Slight puffiness of the eyelids was noted in the early hours of the morning when the transfusion was stopped.

At that time the pulse rose to 88. With the exception of one reading (at 9.30 p.m.) the pulse had not exceeded 84 prior to this last reading.

She was well next day. The change was very gratifying. The blood counts before and after transfusion were:

	Hb g./100 ml.	Hb %	R.B.C.	Retic.	C.I.
July 17	3.3	22	1.12	14.8	0.99
" 18	3.4	23	1.07	15.2	1.08
Transfusion					
July 19	10.1	68	4.02	2.2	0.84
" 24	8.4	60	3.444	1.0	0.87

The following night she developed dyspnoea, due to pulmonary oedema, which by 9 a.m. next day was severe. It responded to oxygen and rest, and by the afternoon she was perfectly well. No further complications occurred. She was resistant to treatment with liver extracts, and underwent a further transfusion at a later date. The transfusion was a slow direct transfusion without any venous escape and was well tolerated. Her haemoglobin when this transfusion was carried out was 32% (4.7 g./100 ml.).

Comment

It is suggested that exchange transfusion by the method described is indicated in (1) cases of severe anaemia with congestive heart failure, and (2) cases of severe anaemia (Hb 25% or lower) of many weeks' duration but not associated with venous congestion.

The advantages of the method are: (1) There is a greatly reduced risk of circulatory overloading, since the blood volume is controlled; and (2) the transfusion is more quickly done than with the usual practice of giving several small slow transfusions over the course of a few days.

Summary

A technique for exchange transfusion, in which exsanguination and transfusion are simultaneous, is described.

Three cases of severe anaemia are reported in which exchange transfusions were performed.

Indications for, and advantages of, exchange transfusion are mentioned.

My thanks are due to Dr. C. C. Ungley without whose help this paper would not have been written. They are due also to Mr. H. Campbell for the statistical interpretation of results, to Professor Duguid for the pathological data given, and to the medical and nursing staff of wards 10 and 12, Royal Victoria Infirmary, Newcastle-upon-Tyne, for their help and encouragement.

On March 19 the first party of 25 British children left for Vordinborg, in Denmark, under the Anglo-Danish Society's scheme for their treatment at a Danish sanatorium. The children were chosen by the medical committee of N.A.P.T., and the British Red Cross helped to make the travel and welfare arrangements. Funds to meet the cost of transport and maintenance of this and subsequent parties of British children suffering from tuberculosis will come from the special fund created for the purpose by the Anglo-Danish Society. The ages of the children range from 8 to 15; there are 14 boys and 11 girls, mainly from London and the Birmingham and Oxford regions. It is expected that treatment in most cases will last about six months. The scheme will do something to reduce the waiting-list for beds in this country.

HOMOLATERAL PYRAMIDAL SIGNS WITH TUMOURS OF THE POSTERIOR FOSSA

BY

LESLIE C. OLIVER, F.R.C.S.

Neurosurgeon, West End Hospital for Nervous Diseases
and Royal Northern Hospital, London; Surgeon in Charge
of Neurosurgical Centre, Oldchurch Hospital, Romford

AND

J. R. GIBBS, F.R.C.S.Ed.

Senior Surgical Registrar, Neurosurgical Centre, Oldchurch
Hospital, Romford

It is well known that tumours and other displacement lesions of the cerebral hemispheres sometimes give rise to homolateral pyramidal signs. Kernohan and Woltman (1929) made a careful study of this phenomenon. The expanding lesion causes displacement of the brain stem, so that indentation of the *opposite* cerebral peduncle is produced by the edge of the tentorium; the affected pyramidal fibres cross below, in the decussation of the pyramids, to the same side as the lesion. The following case is cited as an example.

Illustrative Case

Case 1. Subdural haematoma of the right hemisphere: weakness of the right hand and arm, and equivocal right plantar response.—A man aged 47, who suffered from sleepiness for three months and headache and irritability for one month, became suddenly unconscious on June 22, 1946. There was no history of a head injury. On admission to hospital the same day he was conscious but very drowsy. There was no papilloedema and there were no localizing signs. The cerebrospinal fluid contained 80 mg. of protein per 100 ml., and it was yellow after treatment in the centrifuge. During the next few days the drowsiness fluctuated. Two weeks after admission the patient was referred to us. At that time there was *weakness of the right hand and arm* and the *right plantar response was equivocal*. Ventriculography, performed on July 6, showed displacement of the anterior part of the ventricular pattern to the left. A right frontal burr-hole revealed a subdural haematoma, which was solid and adherent to the membranes. A bone-flap was turned down and the haematoma exposed after wide reflection of the dura mater. The whole of the superolateral surface of the hemisphere was involved. There was no haematoma on the opposite side.

Comment.—It is not so well known that a closely similar phenomenon may occur with tumours in the posterior fossa, though Kernohan and Woltman found records of five examples in the series of intracranial tumours which they investigated, and Gould (1928) stressed the occurrence of homolateral hyperreflexia with some tumours of the posterior fossa. Tumours of the frontal region may produce "cerebellar" signs, and, conversely, slowly growing tumours in the posterior fossa may cause little or no disturbance of cerebellar function. Therefore the possible occurrence of pyramidal signs on the same side as a posterior fossa tumour may cause further difficulty in diagnosis.

In the following five cases various homolateral pyramidal signs were observed.

Case Reports

Case 2. Cyst of the left cerebellar hemisphere: paresis of the lower half of the face and weakness of the upper extremity on the same side.—A woman aged 46 was admitted to hospital in April, 1949, with a six-weeks history of intermittent headaches, giddiness, and vomiting. She showed a

mild degree of neck stiffness, moderate hypotonia of all the limbs, brisk knee-jerks, and considerable apathy. The patient refused ventriculography and left the hospital. She was readmitted six weeks later with bilateral frontal headache and insomnia. Diplopia had been noticed for two weeks. She was doubly incontinent, and neck rigidity, bilateral papilloedema, *marked left lower facial paresis*, and *weakness of the left arm* were present. All the limbs were hypotonic, especially on the left side. The left ankle-jerk was diminished and the plantar reflexes could not be elicited. The patient was given a general anaesthetic, as she refused local infiltration; while the towels were being arranged preparatory to needling of the frontal lobes she suddenly died. At necropsy a large cyst was found in the left cerebellar hemisphere. Microscopical examination of a nodule in the wall of the cyst failed to show any tumour cells.

Case 3. Astrocytoma of the left cerebellar hemisphere: paresis of the lower half of the left side of the face.—A man aged 43 had been perfectly well until three weeks before admission to hospital on October 17, 1949. During this period he had developed headache, vomiting, and severe lassitude; he had also had a cough for the same time. Drowsiness and slight neck stiffness were present, but no other physical signs. Several relations had succumbed to tuberculosis of the lungs; tuberculous meningitis was therefore suspected. The cerebrospinal fluid was slightly turbid; it contained 200 mg. of protein per 100 ml., 500 cells (all polymorphs) per ml., increased globulin, and 80 mg. of sugar per 100 ml. The patient's temperature ranged between 97.8 and 101.4° F. (36.6 and 38° C.). During the next two days deterioration occurred and on October 19 he was transferred to the neurosurgical department in a stuporous condition. There was no papilloedema. *There was a marked left lower facial paresis*, but no other physical signs. Ventriculography showed enlargement of the lateral ventricles and the third ventricle. A large tumour was partially removed from the left cerebellar hemisphere; histological examination showed it to be an astrocytoma.

Case 4. Astrocytoma of the left cerebellar hemisphere: paresis of the lower half of the left side of the face.—A youth aged 17 gave a history of frontal and suboccipital headache, vomiting, and loss of appetite for 14 weeks. On admission to hospital on October 12, 1949, moderate bilateral papilloedema and a slight *left lower facial paresis* were present, but there were no other physical signs. Radiography showed several Wormian bones at the pterion on both sides. Ventriculography on October 18 showed great enlargement of the lateral ventricles and the third ventricle. The posterior fossa was explored through a horseshoe incision. Reflection of the dura mater showed the left cerebellar hemisphere to be more prominent than the right, and there was considerable herniation of the tonsils, the left descending lower than the right. A brain cannula passed into the left cerebellar hemisphere entered a cyst containing 25 ml. of yellow fluid (7 g. of protein per 100 ml.). The cyst and its associated tumour were removed on another occasion (histology: astrocytoma).

Case 5. Solitary secondary carcinoma in left cerebellar hemisphere: paresis lower half of the left side of the face, and positive Babinski sign on the same side.—A man aged 55 was admitted to hospital in coma on February 15, 1950. His wife reported that for two months he had suffered from severe recurrent frontal and vertical headache, recently accompanied by vomiting. For three weeks there had been a cough and thick yellow sputum. He did not respond to pressure on the supraorbital nerves. Marked neck stiffness and advanced bilateral papilloedema were present. Radiography of the chest showed a large shadow on the right side; its appearance was that of a carcinoma of the bronchus. The patient recovered consciousness and was able to cooperate. There was a slight *left lower facial paresis*, a *left Babinski response*, and hypotonia of both legs. There were no other physical signs. The right frontal lobe was needled, but no evidence of a tumour was found. Ventriculography showed enlargement of the lateral ventricles and the third

ventricle. Burr-holes were made over the cerebellar hemispheres and a cannula was passed into the left lobe: 6 ml. of thin pus was withdrawn; the fluid contained pus cells, but no tumour cells. Penicillin was instilled into the cavity and the patient's condition improved. Needling was repeated the next day and tissue containing tumour cells was obtained. The patient died on March 4, and at necropsy a large solitary tumour was found in the left cerebellar hemisphere, secondary to a bronchial carcinoma.

Case 6. Meningioma of the right side of the posterior fossa: positive Babinski sign on the right, and later paresis of the lower half of the right side of the face.—A man aged 48 complained of occipital headaches for six months. At first they occurred only in the morning, but later they persisted throughout the day. For about two months there had been vomiting, loss of weight, and defective memory. He was admitted to hospital on February 8, 1950, with very severe headache, which made him somewhat uncooperative. There were moderate bilateral papilloedema and nystagmoid movements on fixation to either side. There was a *positive Babinski sign on the right side*. Five days later he developed a *right lower facial paresis*, but on this occasion both plantar responses were normal. Needling of the left frontal lobe was negative. Later, ventriculography showed enlargement of the lateral ventricles and the third ventricle. Exploration of the posterior fossa on March 14 revealed on the right side a large extracerebellar tumour, which was removed; it was later shown to be a meningioma.

Comment

The pyramidal signs observed in these cases were all on the same side as the tumour, and included the central type of facial paresis, weakness of the upper limb, and a positive Babinski sign—in variable combinations. It is noteworthy that in none of the cases was any weakness of the lower limb found. The lower limb has never been paretic in our cases of supratentorial tumour with homolateral pyramidal signs. Ectors (1945), however, states that the leg is always affected first, and to a greater extent than the arm, and he attributes this effect to the distribution of the pyramidal fibres in the cerebral peduncles as demonstrated in monkeys: the leg fibres are placed laterally, the arm fibres in the middle, and the face fibres medially (Simpson and Jolly, 1907).

Our own observations are supported by the work of Walker (1949) and of Guiot and Pecker (1949), who have divided the lateral part of the opposite cerebral peduncle for the relief of unilateral involuntary movements. Their case records show that after the immediate post-operative hemiplegia the paralysis recovers rapidly, leaving some residual weakness of the face and arm, with no detectable weakness of the leg.

It therefore appears that, whatever the arrangement of the pyramidal fibres in the peduncles may be, the more important factor is the degree of bilateral cortical representation of the parts concerned. Bucy and Fulton (1933) have obtained ipsilateral motor responses in monkeys by electrical stimulation of the motor and premotor cortex, and their work has been confirmed by Wyss (1938). In classical cerebral apoplexy the arm is more paralysed than the leg; and, after hemispherectomy for infantile hemiplegia, recovery of motor function is more marked in the leg than in the arm (Krynauw, 1950).

Summary and Conclusion

Some intracranial tumours displace the brain stem enough to cause indentation of the *opposite* cerebral peduncle; and thus both supratentorial and infratentorial tumours sometimes give rise to pyramidal signs on the same side as the tumour, and cause difficulty in localization.

The literature on this subject is largely concerned with supratentorial tumours; this communication aims at redressing the balance by the presentation of cases of

infratentorial tumours in which homolateral pyramidal signs occurred and definite cerebellar signs were lacking. The practical implications of the syndrome are indicated.

The association of increased intracranial pressure with mild pyramidal signs, without other localizing evidence, should lead to ventriculography rather than to angiography, unless electroencephalography shows a definite focus of delta activity in one cerebral hemisphere.

Medical Memoranda

Emergency Operation on Patient under A.C.T.H. and Cortisone Therapy

The decision to carry out an emergency operation should not be delayed for fear of a breakdown of the wound and of poor healing due to the effect of the new antirheumatic agents on tissue repair. The following case of a strangulated femoral hernia in which sound healing occurred within the normal time limits shows how wrong it would have been to procrastinate.

CASE REPORT

A spinster chiropodist aged 52 had been treated for rheumatoid arthritis in both hands, elbows, shoulders, ankles, and knees by several courses of gold injections, later with progesterone, and during the past seven months with A.C.T.H. and cortisone. A.C.T.H. was given in doses up to 200 mg. in 24 hours, the cortisone in daily doses of 100 mg., until the day of the operation.

A right femoral hernia, which the patient had first noticed two and a half years previously, was painful for four days and then became tender, firm, and tense. The skin in the groin was found to be red and oedematous. There was a pyrexia up to 100.5° F. (38.1° C.). Lower abdominal pain and sickness followed. An enema gave a good faecal result, with flatus. The pyriform hernia, extending into the femoral triangle, was thought to contain strangulated omentum and it was decided to operate immediately.

Under general anaesthesia an incision was made, starting over the neck of the hernia and extending vertically downwards for 3 in. (7.5 cm.) into the femoral triangle. The tense sac, the size and shape of an outdoor cucumber, contained blood-stained fluid and necrotic omentum, as confirmed on section. This was resected. For the herniotomy and closure of the femoral canal linen thread was used. A corrugated rubber drain was inserted for four days, and the considerable subcutaneous fat layers were closed by interrupted catgut stitches.

Systemic soluble penicillin was given, 250,000 units six-hourly for five days, and ascorbic acid for three weeks post-operatively in doses of up to 100 mg. three times a day by mouth. Cortisone, which was the only antirheumatic agent administered at the time, was reduced from the daily dose of 100 mg. to 75 mg. All sutures were removed on the fourteenth post-operative day. The abdominal symptoms had subsided on the morning after the operation and the wound healed soundly. When examined six weeks later the scar was firm and no cough impulse was felt.

COMMENT

In accordance with the widespread belief in the depressive effect of adrenocortical steroids on wound-healing, through

their influence on connective tissue (Plotz *et al.*, 1950), operations are rarely performed on patients thus treated. Repair is said to be decreased and scar formation largely inhibited if these substances are given in large doses. No reports are available in the British literature on the subject. Hume and Moore (1950), however, report on the use of these substances to improve the general condition in surgical patients. The wound in my patient healed in spite of the presence of inflammatory changes in the skin and omentum, and in spite of strangulation. Cessation of cortisone treatment may have led to a sudden loss of stimulation of the suprarenals and to a rebound exacerbation of rheumatoid and mental symptoms.

Some precautions to safeguard wound-healing could, however, be accepted as rational. General anaesthesia was used in preference to local analgesia, which may temporarily lower the vitality of the tissues; chemotherapy was indicated, even if sepsis would not have threatened; and ascorbic acid was tried empirically to block the effect of cortisone on mesenchymal tissues. Non-absorbable suture material is preferable, as it maintains in apposition tissues the wound-healing of which is potentially impaired. The lower approach to the femoral hernia was chosen in preference to Lotheissen's because the content of the sac was thought to be omentum, and because the apex of the elongated sac extended direct into the femoral triangle. The possibility of the breakdown of the wound was a contributory indication for the lower approach, where the structures in the inguinal region were not endangered. The fact that the patient's wound had healed after a dental extraction in the third month of A.C.T.H. therapy was an encouragement for immediate operation. It was also remarkable how indefinite and masked the clinical symptoms were and that even the rise of temperature was delayed in the presence of sepsis and of strangulation. This was probably due to the lowered vitality of mesenchymal tissue. The administration of the new antirheumatic substances should, however, not deter the surgeon from an emergency operation, which should, if required, be performed without delay.

I am indebted to Mr. J. M. Milloy, Dr. B. Gottlieb, Dr. A. Poteliakhoff, Dr. O. Savage, and Dr. I. M. Tweed for their kind interest in this case and for their advice.

Glandular Fever

The five cases of glandular fever reported below all occurred in one district within eight months; no connexion, however, has been traced between any two of them. Chloramphenicol was given early in two cases and later in two others without affecting the course of the disease. This would tend to refute the conclusions drawn by Kane (1951). Three cases were similar and typical, and two had unusual courses. A sign which may be helpful in diagnosing the atypical case, and which was present in all cases, is described.

CASE REPORTS

Case 1.—A male clerk aged 26 felt ill on November 7, 1950, but ascribed it to the shock of the death of his mother, whom he had been visiting in a regional hospital (in which he may have been infected). On November 14 he went to bed with fever and sore throat, and was found to have an adenitis out of proportion to the existing tonsillitis. The glands involved were those under the upper parts of the sterno-mastoids and also in the axillae. On

November 16 exudate was present in a membranous plaque over both tonsils, and there was complete nasal obstruction. On this day the total white-cell count was 26,500, of which 89% were mononuclear. The Paul-Bunnell reaction was positive in a dilution of 1 in 28. He began taking chloramphenicol on November 17 in divided doses totalling 3.25 g. daily. On November 21 the exudate had cleared and there was general improvement in fever and in the degree of adenitis. The nasal passage was clear. On the 23rd the total white-cell count was 7,500, but mononuclears formed 76%. The mouth and tongue were sore, but chloramphenicol was continued until November 26. Repeated white-cell counts showed a normal total, with the mononuclears falling slowly from 73% on December 4 to 53% on January 6, 1951, when he returned to work. The proportion was still 52% when he was last seen on March 6. The prodromal stage and the acute stage each lasted about a week, and the patient was off work for two months.

Case 2.—A bright young female hairdresser aged 18 was seen on January 6, 1951, with a small indefinite urticarial rash about the neck and shoulders, which cleared in a week. At this time a menstrual period, abnormally delayed for a fortnight, appeared. On January 17 she went to bed with fever, sore throat, and adenitis. On the 20th an exudate was present over both tonsils, the nose was blocked from behind, and the total white-cell count was 14,200, of which 75% were small lymphocytes. Chloramphenicol was given on January 21 in a total daily dose of 3 g. and continued for eight days, during which time the membrane separated, the fever and adenitis subsided, and the nose cleared. The Paul-Bunnell reaction was positive in a dilution of 1 in 3,584. The total white count was normal on January 29, but mononuclear cells formed from 60 to 70% until she was last seen on June 16. The prodromal stage lasted 10 days, the acute stage lasted about 10 days, and she was off work for nearly three months.

Case 3.—A girl aged 8 had not been well for a fortnight before she was first seen on July 14, 1951, when she complained of a sore throat. There was no exudate, and it was noted that the bilateral glandular enlargement seemed excessive and was situated chiefly under the upper part of each sterno-mastoid. The temperature was 101° F. (38.3° C.), and she was given "sulphatriad" suspension. On July 16 there was still fever, with a follicular exudate on both tonsils and complete nasal obstruction. A few slightly enlarged glands were present in the axillae and groins. The girl had not been immunized, so 20,000 units of diphtheria antitoxin was given. The white count was 13,200 (polymorphs 47%, lymphocytes 48%, monocytes 5%). The fever and the pharyngeal condition remained the same until July 19, when the fever ceased and the glands decreased in size. Next day the exudate had gone. On the 23rd the nose became clear, coinciding with great reduction in the glandular enlargement. On July 26 the Paul-Bunnell reaction was positive in a dilution of 1 in 448, the total white count was normal, but 87% were lymphocytes and mononuclear cells. On July 30 the child was up and playing about.

Case 4.—The young wife of a professional man had an illness the onset of which was insidious but probably occurred late in September, 1950. She felt tired and had a frontal headache which was severe, especially in the mornings, and which persisted for about a month. For the last three weeks in October there was a low evening fever. She had some halitosis, one small epistaxis, a blockage of the right eustachian tube, and a markedly nasal voice. In spite of the absence of any nasal catarrh the sinuses were examined radiographically and a condition of mucosal thickening was reported in both frontal and both maxillary sinuses. A blood count on November 9 showed: Hb, 62% (8.7 g.); white cells, 5,400 (lymphocytes 60%, monocytes 26%). The Paul-Bunnell reaction was positive in a dilution of 1 in 448. Chloramphenicol was started on November 14 in total daily doses of 2.5 g., and continued for six days. On the 16th the spleen was just felt and a

few small glands were found in the posterior triangles of the neck. The fever had settled. She had been in bed about nine weeks. Convalescence was extremely slow, with physical weakness and mental depression lasting until early in the new year. The blood count was normal in February, 1951, though the haemoglobin was still low (75%).

Case 5.—A male weaver aged 29 attended on January 8, 1951, for a fever with slight cough and some backache which settled in three days. On January 17 he developed jaundice, having had nausea, anorexia, and upper abdominal discomfort for a few days previously. The jaundice lasted a week and was clearing when, on January 20, he developed fever, a tonsillitis with membranous exudate, nasal obstruction, and many small palpable glands all over the neck. The Paul-Bunnell reaction was positive in a dilution of 1 in 896. Chloramphenicol was started, and was continued for six days in a total daily dose of 3 g. The total white-cell count was 24,000, of which mononuclear cells formed 89%. The acute stage lasted until January 27. On February 9 the total leucocyte count was normal, but mononuclear cells still formed 71%; on June 16 the mononuclears totalled 69%. He was off work for over three months.

COMMENT

Four of the cases were of the anginose type, though three were in young adults. The clinical picture was practically identical in the first three cases. In two of these chloramphenicol was given reasonably early, in adequate doses, and continued for about a week. In the third it was deliberately withheld. The course in all three diseases was identical. The two other cases had chloramphenicol at a later stage without any effect that could be attributed to its use. Prodromata were generally vague, but Case 2 had a rash and amenorrhoea. This symptom has not been found to be recorded before. Case 5 was remarkable. Mild upper respiratory infection was followed by hepatitis with jaundice, and finally by typical monocytic angina. It is not possible to say whether this was a single infection or a succession of two or three separate infections. The latter seems unlikely.

All the patients showed evidence of enlargement of the adenoids, with nasal obstruction in four. Eustachian obstruction occurred in one (Case 4): it was for a fortnight the only evidence of enlargement of lymphatic tissue in this difficult case, and was therefore a very significant sign. Nasal obstruction was not unimportant in the others, for its presence contributed materially to their discomfort during the day and their restlessness at night.

Although Custer and Smith (1948) report nasopharyngeal lymphoid hyperplasia as a constant finding in nine necropsies, no mention is made of nasal obstruction as a symptom or sign of the disease, nor has it been found mentioned in any other articles. It is interesting that lymphatic communications exist between the upper nasopharynx and the sub-arachnoid space, in view of the association of a lymphocytic meningitis with glandular fever. Glandular fever is not uncommon. Ten cases have been diagnosed in the last five years, while no case of diphtheria has been seen,

Speaking at the Royal Institution on March 14 Professor J. Read said there was little realization to-day of the extent to which alchemical conceptions and imagery permeated the thought and art of the Middle Ages. Most of the early alchemical engravings delineated apparatus and practical operations. Early in the seventeenth century, when alchemy had already begun to wane, some of the most interesting and artistic engravings were produced. This period coincided with the development of copper engraving. Alchemical engravings of this period often called up visions of surrealist paintings. Indeed, surrealists had much to learn from the disturbing and incongruous juxtapositions of alchemical art.

Reviews

TUMOURS OF THE EYE

Tumors of the Eye. By Algernon B. Reese, M.D., D.Sc. (Hon.), F.A.C.S. (Pp. 574; 511 illustrations, 122 in full colour. £7 7s.) London: Cassell and Co. 1951.

Occasionally, but only occasionally, a really good book appears in medicine: this is one. Those of us who have visited Algernon Reese in his laboratory at the Presbyterian Medical Centre, New York, would expect a book of his on the tumours of the eye—a field which he has made his own specialty for many years—to be original, reflecting his own views and personality. Those of us who have seen the impressive amount of pathological material which passes through his hands and the elaborate care with which it is studied and filed, so that it is available for constant reference, would expect it to be accurate, well presented, and comprehensive; and those of us who have seen him in the clinic would expect the pathology to be integrated with careful and illuminating clinical data and sound therapeutic recommendations. In none of these will the reader be disappointed.

It is astonishing how many types of new growth may be met with in the eye and its adnexa, some rarely, some commonly, so that a study of ocular tumours must needs be almost a complete treatise on neoplastic growths. Dr. Reese's long association with the Memorial Centre for Cancer and Allied Diseases in New York, in addition to his ophthalmological activities, has made him eminently fitted to correlate the characteristics and evolution of ocular tumours with those of tumours found elsewhere in the body, so that his book has an integrative philosophy rarely met with in ophthalmological publications, and it must be of interest to the general pathologist as well as the eye specialist. All these qualities—in addition to the fact that it is the first textbook dealing exclusively and extensively with this subject since Lagrange's classical publication in 1901—makes it an indispensable reference book. It is true that it is superbly published on art paper, beautifully printed, and replete with illustrations, many of them in colour; but in view of the value of its contents it is perhaps a pity that its cost puts its possession outside the scope of the student. In this respect the rising cost of books of this type has indeed become a problem, and it may be that a more "popular" edition might replace in ultimate value what would be lost in luxury.

STEWART DUKE-ELDER.

THE ELDERLY

Trends in Gerontology. By Nathan W. Shock. (Pp. 153. £1.) Stanford, California: Stanford University Press. London: Geoffrey Cumberlege. 1951.

The Social and Biological Challenge of our Ageing Population. Proceedings of the Eastern States Health Education Conference, March 31–April 1, 1949. (Pp. 184. 18s.) New York: Columbia University Press. London: Geoffrey Cumberlege. 1950.

The problems and burdens of an ageing population are one of the main anxieties of civilized peoples. A falling birth rate in many countries has been accompanied by an increase in the number of people reaching the higher age groups. This does not mean that there has been any increase in the ultimate expectation of life: that has not changed much. But a greater number of people than 50 years ago are now reaching normal old age. This is due in part to improvements in environmental hygiene, in part to the use of various new drugs, of which the antibiotics are the most obvious, and in part to causes we do not know. But the effect has been that there are fewer working people available to support an increasing unproductive section of the population, for it must not be forgotten that what used to be called "useless mouths" are increasing at both ends of the scale.

But, worse than this, a policy of "full employment" and a worsening economic state of society have removed many people who would formerly have looked after their aged relatives into a more materially profitable sphere of work. Rowntree and Lavers, in their latest report, have shown that it is the old and the infirm who have not profited from the benefits of the Welfare State. It is interesting, therefore, to read in these two books from the U.S.A. of the problems that are facing administrators in that country and to find how similar these are to those that are found here.

In both books the discussion centres round the two main sides of the problem—the socio-medical one: What are we to do now, and in the immediate future, to ensure that old age shall be as pleasant and agreeable a time as were earlier years? The other (and much long-term work is needed here) is, What are the causes of ageing, and how can they be either mitigated or checked altogether? For such a plan both books ask for an increase in the facilities for biological research. Dr. Shock puts forward a well-argued plea for an institute of gerontology where the treatment of aged patients shall be carried on in association with research into the cause of their particular reaction to various illnesses and with a study of the socio-economic problems of old age. In addition, steps would be taken to encourage education of workers towards their retirement, so that they may be prepared, willingly, to accept new, perhaps less responsible, employment as a natural consequence of their growing older. There is something to be said in support of this plea, provided it is not forgotten that preventive measures can reduce the numbers requiring admission to hospital and that the elderly are best treated in wards that are an integral part of a general hospital. It is dangerous to push the specialty of geriatrics, if indeed it is a specialty, too far into isolation.

It is interesting to note how the proportion of elderly workers remaining in employment has steadily fallen since the beginning of the century in the U.S.A. as well as in this country. Yet the health of the elderly worker has, so far as can be made out, improved during the last 50 years. A good deal of work needs to be done to determine whether the added years that have been given to so many are really being used to their best advantage. The incentives to continue at work are not high, yet any physician can testify to the value of suitable employment in maintaining a healthy mind and body.

Dr. Shock's thoughtful and accurate little book is an interesting addition to the small collection of books on old age, while the collected papers from the New York conference contain a lot of useful information and, even more, of stimulating and provocative ideas.

AMULREE.

GYNAECOLOGY FOR STUDENTS

Handbook of Gynaecology. By Trevor L. S. Baynes, M.D., F.R.C.S., M.R.C.O.G. (Pp. 164. 15s.) London: Sylvio Publications. 1951.

This small book is a most interesting publication. It is well known among clinical teachers that there is a demand by senior undergraduates and postgraduate students for concise summaries to integrate all that they have read. In this volume the author has been at pains to avoid giving an exhaustive account of gynaecology and has written short essays on topics which are in the forefront of gynaecological thought. The essays combine theoretical considerations and descriptions of clinical investigations and operative technique. They are very well written, concisely arranged, and the reader has no difficulty in grasping quite easily the basic problems of the topic under discussion. Although the book is expensive, it may be confidently recommended to senior students and postgraduates.

Printing mistakes are numerous, and the spelling of such words as colporrhaphy should be accurate in a gynaecological textbook, nor should the names of Schröder and Sims be spelled wrongly.

WILFRED SHAW.

THE NEWBORN

Foetal and Neonatal Pathology. By J. Edgar Morison, M.D., B.Sc. (Pp. 366; 59 figures. £2 10s.) London: Butterworth and Co. 1952.

Dr. J. E. Morison has produced in *Foetal and Neonatal Pathology* an interesting and informative book, although the title is misleading. It is, of course, difficult to separate entirely some of the physiology of neonatal life from some of the disturbances which occur in the newborn period. A study of respiratory failure must take account on the one hand of the normal mechanism for the initiation of respiration after birth and on the other of the morbid changes found in babies who do not breathe properly. Whether or not these two aspects, the former to some extent wrapped up with clinical considerations, can strictly be treated together as pathology is open to doubt. To this extent Dr. Morison is sometimes rather muddling. When writing of strictly pathological changes he gives the impression of being very much on his home ground, where he has made valuable contributions to the subject. But in the section on prenatal disturbances, discussions on foetal nutrition and growth, for example, are less well done, and the chapter on prematurity might have been better balanced if a clinician with extensive experience of care of these infants had collaborated. (Incidentally, the Royal College of Physicians, not the Royal College of Obstetricians and Gynaecologists, was the body which took the lead in Great Britain in securing a definition of prematurity.) The third part of the book is on infections and is an interesting account of this most important and somewhat neglected field. Dr. Morison's own work on thrombosis in sepsis of the newborn is well summarized. The whole book is ambitious, well illustrated, and beautifully produced. It might be improved by limiting its scope to what has been observed in the study of disease.

ALAN MONCRIEFF.

DISEASES IN THE NERVOUS SYSTEM

Medical Neuropathology. By I. Mark Scheinker, M.D. Preface by Marion A. Blankenhorn, M.D. (Pp. 372; 186 figures. £3 15s.) Springfield, Illinois: Charles C. Thomas. Oxford: Blackwell Scientific Publications. 1951.

The title of this book does not quite explain its scope: it is essentially an account of the pathological changes in the nervous system which occur in diseases primarily involving other systems of the body, and it does not include all the non-surgical diseases of the nervous system. It is a companion volume to the author's two previous books on *Neurosurgical Pathology* and *Neuropathology: Its Clinicopathologic Aspects*. About half of the book is concerned with changes in the central nervous system in cardiovascular disease, and Scheinker develops the theory (on which he has published a number of papers) of vasoparalysis, vasoparalysis, and vasothrombosis as the basis of reversible vascular disturbance in the brain. The last term implies thrombosis of "tremendously" dilated small cerebral venules and capillaries, and he reiterates his view that the majority of intracerebral haemorrhages in hypertension are of venous rather than arterial origin.

In other sections of the book he describes the cerebral manifestations of lung diseases and includes an excellent account of tuberculosis of the nervous system, neurological disturbances in the blood dyscrasias, and cerebral reactions to chemotherapy and various exogenous poisons. The short section on cerebral manifestations in liver diseases is disappointing; there is no account of recent biochemical findings in the discussion on the pathogenesis of hepato-lenticular degeneration, and, more surprisingly, Rh incompatibility is not even mentioned in the corresponding section on kernicterus. The chapter on the pathology of polyneuritis includes a description of considerable swelling of the nerve fibres of the spinal-cord roots and tracts and of the cranial and peripheral nerves in acute infective polyneuritis, and attributes the neurological disturbance in "jake"

paralysis to muscle ischaemia resulting from changes in the peripheral arteries.

If this book is regarded as the author's somewhat individual outlook on certain aspects of neuropathology, it provides interesting and provocative reading, but it could not be recommended as an orthodox account of the subject. It is profusely and excellently illustrated.

J. W. ALDREN TURNER.

OESOPHAGEAL ACTION

The Esophagus and Pharynx in Action. A Study of Structure in Relation to Function. By William Lerche, M.D. (Pp. 222; 93 figures. £2.) Springfield, Illinois: Charles C. Thomas. Oxford: Blackwell Scientific Publications. 1950.

On the cover of this book the claim is made that it will be accepted as a great classic and the most authoritative source of information on the subject in the world. It is difficult for your reviewer to decide if this is so. The book records a painstaking and earnest attempt to analyse and present the problem, based partly on a review of the literature and partly on personal observations and anatomical dissections of 100 specimens. In the embalmed material specimens were found which suggested that agonal regurgitation had occurred, and from these the author gives an interpretation of the mechanism of closure and action of the lower end of the oesophagus. The description of the muscular sphincteric mechanism is interesting. The conclusions are reinforced by deductions from various clinical observations, which are, however, often less convincing; they are usually unsupported by more than a personal statement of opinion. The detail of many of the photographs could be improved, and there is a startling absence of modern radiographs. It is also somewhat disconcerting to find no mention at all of Allison's observations and work on the cardiac mechanism.

It is certain that all interested in the oesophagus and pharynx should read this book, and most will wish to possess it.

R. C. BROCK.

FOR THE YOUNG SURGEON

Anatomy in Surgery. By Philip Thorek, M.D., F.A.C.S., F.I.C.S. (Pp. 970; 720 illustrations, 211 in colour, drawn by Carl T. Linden. £9.) Philadelphia and London: J. B. Lippincott Company.

There is a stage in the training of every surgeon when, having acquired a solid knowledge of human anatomy, he wishes to learn how this can be applied to the technical procedures of surgery. It is for the embryo surgeon at this stage that this volume is intended, and in spite of its cost he will find it a valuable investment. It is neither a textbook of anatomy nor of operative surgery, but it provides a bridge over the difficult region between the two.

As it covers the whole field of surgery it naturally cannot give all the technical details required for the actual performance of any operation, but it does give a very fair idea of even the most advanced surgical procedures and those of the most recent date, such as retropubic prostatectomy and excision of the oesophagus, showing clearly the anatomical problems involved and giving all the information that the student need require at this stage. Of some regions, however, a much fuller account is given, and the chapter on the surgery of the hand reaches a high level; it may well be instructive to the most expert surgeon.

The whole volume is finely produced, and profusely illustrated by one of the leading surgical artists in America. The drawings are devised and produced with equal skill and are a superb example of collaboration between surgeon and artist. To the teacher who wishes to present to his students modern surgical technique in a clear and accurate manner the volume will be invaluable. To the advanced student it should prove a sound introduction to the whole field of modern surgery.

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY MARCH 22 1952

GROWTH PROMOTERS

The existence of vitamin B₁₂, which is the name now given to a red-coloured cobalt compound present in animal protein and certain micro-organisms, appears to have been first realized in 1931 by Castle.¹ As the "extrinsic" factor necessary for the cure of pernicious anaemia it had to be provided in the diet and supplemented by supplies of the "intrinsic" factor, which the diseased stomach walls were unable to elaborate. Shortly afterwards Mapson² showed that liver, the outstanding source of the "extrinsic" factor, was also potent in promoting growth in rats. The substance responsible was different from all the vitamins then known, and was effective whether given directly to the young animals or to their mothers during lactation. It appeared to induce growth above the normal level and was given the name "physin."

These pioneer observations stimulated little progress for the next 15 years. During the past five years, however, rapid advances have led not only to the recognition that the anti-anaemic and growth-promoting principles are the same remarkable substance, but to the extension of the field of interest to microbiology and the antibiotics. Thus Rickes³ in America and Lester Smith⁴ in London have isolated Castle's "extrinsic factor" in the form of pure vitamin B₁₂, and clinicians have since shown that it is effective in the treatment of pernicious anaemia in very minute doses.⁵ Mapson's physin has been rediscovered as the "animal protein factor" by American workers interested in rearing pigs and poultry on cheap vegetable diets. The study of its distribution, however, has been extended beyond liver, and fish meal and other animal foods have been found to promote growth. Of great significance was Bird's⁶ observation that cows' dung may act as a source of the animal protein factor to chicks, since this finding was an important clue pointing to micro-

organisms as the ultimate source of the factor. Eventually it was recognized that vitamin B₁₂ prepared from liver could promote growth in animals receiving a vegetable diet, while conversely vitamin B₁₂ isolated from materials previously studied as sources of the animal protein factor could cure pernicious anaemia. Culture media obtained as a by-product to the production of antibiotics replaced liver as the main commercial source of the vitamin, and the stage was set for another interesting advance.

In experiments with the crude fermentation products of *Streptomyces aureofaciens* Jukes and his colleagues⁷ observed a higher growth-promoting power than could be explained by the concentration of vitamin B₁₂. Later he succeeded in isolating "aureomycin," and found that the growth-promoting activity of the crude product could be reproduced by the joint administration of this substance with vitamin B₁₂. In both pigs and poultry aureomycin substantially increased the growth rate, thus giving the antibiotics a new and unexpected part in aiding the efficient and cheap production of food. Penicillin and terramycin were also effective, and there have even been reports that under suitable circumstances sulphonamides may increase growth. It has been reported that in the U.S.A. the sale of antibiotics in food for farm animals is greater in quantity than the amount used in clinical medicine.

Cuthbertson⁸ has recently commented on this important development and has suggested that growth stimulation in poultry by antibiotics may depend on both the basal diet and the microbial environment. The divergent reports from different workers suggest that antibiotics will be most effective in improving growth when the diet is deficient in animal protein or when the bacterial environment is unsuitable. That at least some types of bacteria are beneficial may be inferred from the success of the "deep litter" method, in which the birds' faeces are allowed to accumulate for prolonged periods in a thick layer of peat, or some similar material, and are kept at a temperature suitable for bacterial growth. Indirect effects—such as the accumulation of vitamin B₁₂ in the flooring and the preventive effect of the heat and dryness caused by fermentation on the growth of parasites—may at least partially explain the success of this remarkable procedure.

The history of vitamin B₁₂, it will have been noticed, has gained interest from an exchange of clues between the medical specialist, interested in the cure of pernicious anaemia, and the agriculturist, interested in the cheap production of ham and eggs. The extension of interest to aureomycin has shown the same tendency, with the agriculturist both receiv-

ing information and repaying. If the antibiotic aureomycin is effective in increasing growth in animals, may it not have the same effect in humans? Controlled trials to answer this question have recently been reported by Robinson⁹ from Israel. Studies were made of the progress of 11 sets of premature twins and two sets of premature triplets: 13 of the infants were given aureomycin by mouth for periods up to four weeks, and 15 were left undosed. The results appeared to be encouraging. All the treated infants survived, but five of the controls died: the average weight gain per day was 29 and 18 grammes respectively. Robinson has emphasized that these results may have been due to the antibacterial action of aureomycin rather than to a direct growth-promoting activity. The same question obviously remains to be answered about the stimulation of growth in farm animals. Antibiotics which are elaborated by organisms which also produce vitamin B₁₂ will perhaps tend, when taken orally, to encourage the growth in the intestinal tract of organisms having metabolic habits similar to those from which they were derived. The administration of one metabolite, aureomycin, might therefore stimulate the production of another metabolite, in the form of vitamin B₁₂. Experiments by Coates¹⁰ on calf dung, however, have shown that there are substances which have the potency of vitamin B₁₂ when tested upon micro-organisms, but which are ineffective in promoting growth in chicks. Further research, therefore, is obviously necessary before the exact relationships between vitamin B₁₂ and the antibiotics can be explained with reasonable confidence.

MEDICAL CERTIFICATION OF CAUSE OF DEATH

Despite the growing interest now being taken in statistics of non-fatal as well as fatal disease, the mortality statistics of this country have long been and will long continue to be an essential index of the health of the people. Mortality statistics provided incentives for the sanitary reforms of the nineteenth and early twentieth centuries and demonstrated the dramatic results of these reforms. More recently they have measured the results of spectacular advances in preventive and curative medicine, surgery, and obstetrics. They also indicate directions where progress has been disappointing, fields where more research or the fuller application of available knowledge is urgently needed, and on occasion draw attention to ominous trends of mortality requiring investigation and explanation.

The essential foundations of mortality statistics are the medical certificates of cause of death which practitioners are statutorily required to provide when their patients die. Half a million of these certificates are issued in this country every year, and upon them has been established the national system of mortality statistics that for over a century has served as an example to the rest of the world, bearing testimony to a long and fruitful collaboration between the Registrars-General and the medical profession.

The quality of mortality statistics can be no better than the quality of the death certificates on which they are based, and the completion of these certificates is sometimes a difficult task. The certifier has to make up his mind what was the cause of death—and this, particularly with the newborn and with the elderly, is often a complex diagnostic problem. He has also to decide whether to mention one or several causes on the certificate, and how best to present these causes and indicate their relative importance. In the London area in 1945 some two-thirds of a sample of death certificates were found to have mention of more than one cause of death, and on a sixth of the certificates at least three definite causes were stated.¹

Since the beginning of 1950 the prescribed form of death certificate in England and Wales and Northern Ireland has been the international death certificate recommended by the World Health Organization for use by all countries where mortality statistics are compiled. To guide and instruct practitioners in the use of the international form of certificate (which, it should be noted, is not yet in use in Scotland) W.H.O. has published a small booklet² that describes the structure of the death certificate; explains the importance of recording the causes of death lucidly, concisely, and in correct order if the certifier's meaning is to be properly understood; and illustrates what is meant by direct, antecedent, underlying, and contributory causes of death and how they should be distinguished and recorded. The underlying cause of death, which is the one selected for statistical assignment, is the condition which initiated the train of events leading to death; in a properly completed certificate it would be the last or the only cause to be mentioned in part I of the form. The booklet also explains why certain terms are considered indefinite or inadequate and lists many of the descriptions that are found unsatisfactory and that lead to requests for clarification or for additional details.

¹ *The Registrar-General's Statistical Review of England and Wales for the Six Years 1940-1945*. Text, Vol. 1, Medical, 1949, H.M.S.O., London.

² "Medical Certification of Cause of Death." *Bull. World Hlth Org.*, 1952, suppl. 3.

³ Reprinted from *The Registrar-General's Statistical Review of England and Wales for the Six Years 1940-1945*. Text, Vol. 1, Medical, 1949, pp. 81-3, H.M.S.O., London.

⁴ *The Registrar-General's Statistical Review of England and Wales for the Two Years 1946-1947*. Text, Vol. 1, Medical, 1951, H.M.S.O., London.

The introduction of the international form of death certificate has caused little change in existing practice in England and Wales, where an almost identical certificate had already been in use since 1927, the only addition required in 1950 being the panel for the statement of duration of each of the conditions mentioned. Some remarks on defective death certification were sent to practitioners at the beginning of 1950,³ and of course there are explanatory notes at the beginning of each book of certificates. Nevertheless the Registrar-General apparently finds it necessary to send out some 10,000 requests to doctors for supplementary information each year⁴ in order that causes of death can be classified with sufficient precision to meet the increasingly detailed statistical needs of clinical, public health, and research workers. Many of these inquiries may be unnecessary if the information and suggestions contained in the W.H.O. booklet become better known and applied by certifying practitioners and are used in the training of medical students and newly qualified doctors. To furnish careful and accurate certificates of cause of death is an important responsibility of the medical profession, and it is the medical profession that is the principal user of the statistics derived from analysis of the certificates.

ECONOMICS AND DOCTORS

Before the end of the month the estimates of the cost of the Health Service in the coming year will be made known. This week a book¹ has been published which is an illuminating commentary on the cost of the Service, purporting to show why it has so grossly exceeded the original estimates. The book is by Dr. Frangcon Roberts, and it is written for laymen. Readers of this *Journal* will, in fact, be familiar with his views, some of which were expressed in an article as recently as February 9 (p. 324). But all doctors ought to read his stimulating and provocative book. They will be entertained and instructed.

Most doctors will agree with his diagnosis. The application of science to medicine has made investigations infinitely more elaborate and treatment more refined than 50 years ago. Pathological and x-ray examinations multiply; some of the new drugs have to be accompanied by complicated tests for weeks and months. This growing elaborateness of medicine is not, of course, confined to this country: in the United States it has gone even further. The Health Service cannot be blamed—and Dr. Roberts does not blame it—for this trend in medicine, which is the main reason why the estimates of the Service's cost were so wide of the mark. But he does blame the

administrators who drew up the plans and estimated the cost for not having foreseen how the science of medicine would expand. And he is surely right in holding that now that the Health Service is well established we should take stock and reflect where the indefinite expansion of medicine will lead us.

We should be quite clear about how this trend in medicine has been affected by a health service paid for out of taxes. It may be argued that because the United States, for instance, devotes at least the same proportion of its national resources to the prevention and treatment of sickness as Great Britain, the fact that the country has a national health service is beside the point. The comparison, however, is invalid. The United States has a virile expanding economy and can afford to spend a larger proportion of its national income on health. Further, if Americans wish or have to spend a certain amount out of their personal incomes on treatment, they have that amount less to spend on other things. In Britain conditions are different. First, far too small a proportion of our resources is being saved and invested for the national economy to be able to expand progressively. Secondly, because people do not have to pay out of their own pockets when they use the Health Service they are not compelled to reduce their consumption of other things. The expanding trend of medicine is not checked by limits of personal finance. If it is contended that people's consumption is reduced by the taxation that pays for the Health Service the answer is to be found in the estimates of national income and expenditure in 1951 published last week. Even if allowance is made for higher prices the fact remains that last year the British people, by obtaining higher wages and salaries, increased their consumption more than they increased their production. The result has been the alarming deficit in the balance of payments and the threat to the pound. The place of the Health Service in the fight for national solvency is, therefore, plain. Dr. Roberts put it succinctly in his recent article: "If we want cortisone we must sell more coal."

Whatever they may have thought in 1946 when the Health Service Bill was introduced, few people to-day would disagree with his thesis that the proportion of the national resources allocated to the Health Service must be limited. But Dr. Roberts maintains that we must go further. The resources thus allocated, he argues, should be spent on a system of priorities, and the order of priority should be determined, not by direct individual happiness, but by the economic welfare of the community through which

¹ Frangcon Roberts, *The Cost of Health*, 1952, Turnstile Press, London.

² Winslow, C. E. A., *The Cost of Sickness and the Price of Health*, 1952, Geneva.

the happiness of the individual is indirectly affected. Thus he divides diseases into three groups: those which are not disabling, though perhaps causing individual distress; the disabling; and those in which treatment is humanitarian, prolonging life without effecting a cure and without enabling the patient to work. Dr. Roberts thinks that the resources of the Health Service may have to be concentrated on the second and third groups and treatment of the first group paid for privately. He realizes that his distinctions are not absolute, and he emphasizes that doctors have no concern with the economic value of their patients. Further, the logic of his argument can be seen more clearly if we consider an underdeveloped country with virtually no public health service. As the author of a recent monograph² from the World Health Organization points out, the authorities of such countries have a duty to spend their limited resources on preventive measures, on eradicating the mosquito and the tsetse fly, rather than on building hospitals for the immediate relief of suffering.

No one could accuse Dr. Roberts of hardness of heart, yet some readers of his book may feel that if his views were carried through to their logical conclusion doctors would be in danger of becoming merely the agents of a State medical service, whose main object was to get people back to work rather than to relieve suffering. Hard decisions about the allocation of resources would be left to the economic planners, and doctors would treat all their patients as best they could with the resources that were allowed them. As things are the profession has, of course, a duty to assist the Government in reducing unnecessary expenditure; but the first duty of the practising doctor must always be to the patient who seeks his advice.

PANTOTHENIC ACID

Pantothenic acid is one of the B vitamins that so far has found little clinical application. There is no convincing evidence that it is essential for human nutrition, although this has been assumed, since it is required by a number of species. It is widely distributed in foods; yeast, liver, kidney, wheat bran, and peas being the best sources. Most of it is bound with proteins or amino-acids through an amide linkage ($-\text{CO.NH}-$), which must be broken before the pantothenic acid can be utilized. Pantothenic acid is the prosthetic group or active part of a coenzyme concerned in acetylation known as coenzyme A, which is derived from pantothenic acid, adenosine, and phosphoric acid. It plays a part in the breakdown of fats and carbohydrates and the synthesis of fat from carbohydrate and protein.

Pantothenic acid is absorbed, stored, and excreted by man, and this is sometimes taken as evidence for its necessity in human nutrition. It may be, however, like

some of the non-essential amino-acids, absorbed and excreted but not essential. Human excretion figures suggest that the daily requirement for man, if indeed it is required, is of the order of 10 mg.

The production in animals of nutritional achromotrichia, or greying of hair, by feeding on deficient diets, and its restoration to normal colour by administering pantothenic acid, led to the hope that the vitamin might be of value in the treatment of grey hair in man. There are two common fallacies here; one is that similar symptoms do not necessarily have a common cause; the other, that the findings from animal experimentation cannot necessarily be transferred to human conditions. It has never been shown that dietary deficiency is a factor in the production of grey hair in the ageing human, and reinvestigation of the earlier claims of some enthusiasts that pantothenic acid cures grey hair in man showed that they were completely unfounded. Nicholls¹ and Hughes,² however, believe that greying of hair can occur in malnourished children in the Tropics. Hughes found achromotrichia widespread among the poorly nourished children of Lagos, and he believes that a deficiency of pantothenic acid might be the cause, as the administration of the vitamin seemed to restore the normal colour.

The "burning feet" syndrome, although previously described in the literature on deficiency diseases, was recently seen among prisoners-of-war, particularly in Japanese camps. According to Gopalan³ the injection of calcium pantothenate produced spectacular improvement in these cases. It is not clear whether a deficiency was being remedied or whether the vitamin was producing a pharmacodynamic effect.

As pantothenic acid is a component of the coenzyme for acetylation, it is therefore concerned in the formation of acetylcholine. One would therefore expect that a deficiency of pantothenic acid might result in a loss of parasympathetic tone. In the deficient rat atony and distension of the gastro-intestinal tract occur, the bowel becoming enormously distended, with loss of all peristaltic movements, effects which can be reversed by giving pantothenic acid.⁴ Deficiency of pantothenic acid in the dog is characterized by increased gastric emptying time, pylorospasm, and intestinal hypomotility.⁵ As the bowel changes in rats deficient in pantothenic acid bear a superficial resemblance to those seen in paralytic ileus in man, Jacques⁶ treated 16 cases of ileus with pantothenic acid and claimed that from one to three injections of 50 mg. calcium pantothenate gave dramatic results within two to three hours. It would be of considerable interest if this work were to be confirmed. If it is, obviously the pantothenic acid is acting as a pharmacological agent. There is no reason to believe that human paralytic ileus is a result of pantothenic acid deficiency. The rationale for using pantothenic acid rests on the same fallacy as its use in the treatment of

human grey hair—namely, that similar lesions in different species are due to the same cause.

Another effect that might have some clinical application has been reported by Munan and Einheber,⁷ who state that calcium pantothenate in doses of 100 mg./kg. increases the survival rate of burned rats. This dose is one to two thousand times that normally needed by the rat. One possible explanation of the effect is that in the extensive metabolic changes of burn shock the concentration of coenzyme A in certain tissues becomes critical, thus increasing the requirement of pantothenic acid as an acetylating agent. It would be of interest to study the effect of pantothenic acid or calcium pantothenate on badly burned patients. Up to the present, however, it must be admitted that the vitamin has proved clinically to be something of a disappointment.

ON GIVING EVIDENCE

More often perhaps than most professional men, doctors find themselves in the witness-box in both civil and criminal courts giving evidence both of facts they have observed and of the conclusions to be drawn from those facts: they are usually at the same time witnesses of fact and expert witnesses. The court, not being expert in this sphere, cannot draw unaided conclusions on its own. To give expert evidence is a difficult thing: failure to give it well may have serious effects upon the administration of justice. Mr. A. C. C. Willway, the deputy chairman of Surrey Quarter Sessions, has recently described¹ what can happen, at any rate in prosecutions for being in charge of motor-cars while under the influence of drink, if the medical witness allows himself to be inarticulate or the victim of cross-examination. "By now," Mr. Willway writes, "the jury is completely bewildered and the average jurymen probably says: 'Well, I don't think much of the doctor; I'd have been able to tell whether the accused had had too much to drink without all that rigmarole.' The result is acquittal irrespective of the weight of evidence."

Not alone among the arts, medicine speaks a technical language of its own which, unless translated, is largely unintelligible to most laymen and to most courts. The problem for the doctor is to express in terms understandable to the layman what he has found upon his clinical examination, and to explain in similar terms his reasons for his diagnosis and prognosis. The problem for the cross-examiner is to show that the evidence is not to be relied on either because the examination was inadequate or because the conclusions from it do not make sense. If the examination has been thoroughly made and explained in language the court can understand, and if in diagnosis art and common sense have gone hand in hand, the cross-examiner's task is thankless indeed.

It is often said that there are three kinds of liar: the plain liar, the damned liar, and the expert witness. The grain of truth embedded in this slander is that to give expert evidence well requires the exercise of one of the fundamental skills of the advocate. He has always to remember that the problem which is so familiar to him

is quite new and unfamiliar to his audience. He should therefore explain it as he would explain it to a child. To reduce what is often a complex and difficult question to such simplicity calls for skill, patience, and clarity of thought as well as clarity of expression.

THE PETROL TAX

The general reaction to the Budget seems to have been a faint sigh of relief: the diagnosis was not quite so grave as had been feared and the treatment not quite so drastic. But once again doctors are faced with a rise in their expenses by the additional petrol tax of 7½d. a gallon. This means that a doctor doing 15,000 miles a year with a car that goes 25 miles to the gallon will have to find about another £20, though income-tax relief can be claimed for part of this. Trade and professional users of motor vehicles will no doubt pass this expense on to their clients, and Government-owned transport services will probably do the same. But doctors are not in this happy position, and the great majority of general practitioners especially will have a substantial addition to their expenses.

The B.M.A. has at various times tried, but without avail, to obtain direct relief for doctors from what has now become an exceedingly heavy tax. The previous Ministers of Health conceded that the effect of the petrol tax was bound to be reflected in higher practice expenses. Though the tax has been high for some time, the reason why no financial compensation for former increases was granted is that the Ministers insisted on awaiting the outcome of the dispute on remuneration generally, which is only now to be resolved by arbitration. But before agreeing to arbitration the profession obtained this assurance from the Ministry: "Following an award . . . practice expenses might thereafter be the subject of regular periodical review so that the allowance in respect of them can be adjusted in either direction as may be found appropriate." On the face of it this is an equitable assurance, but it will be useful only in so far as practical effect is given to it by adjusting the remuneration, though any adjustment made is unlikely to be retrospective to cover expenses already suffered. Even so, the agreement is an important one, and no doubt the General Medical Services Committee will soon be taking the matter up with the Ministry. In any case it is likely to be raised some time during the adjudication, which began on March 18. Other branches of the profession are also affected by the tax, and their representatives are considering how this burden may be mitigated. In particular many consultants are dissatisfied with their mileage rates, which will become even more inadequate in view of the additional tax.

A petrol tax is one that falls with peculiar severity on a small part of the nation—the medical profession. In that respect the tax is distinct, for doctors are singled out to pay it whatever their incomes and whatever their desires to buy this or that commodity: the illnesses of their patients dictate the expenditure, while the Government controls the doctors' ability to pay. It is therefore the Government's duty to see that they are not unjustly penalized.

REFRESHER COURSE FOR GENERAL PRACTITIONERS

TENOSYNOVITIS AND TENDOVAGINITIS

BY

D. LL. GRIFFITHS, F.R.C.S.

Senior Orthopaedic Surgeon, North Manchester Hospital Group

Apart from suppurative inflammations of the sheaths of tendons, with which this paper does not deal, there are a variety of painful conditions which custom has loosely grouped together under the term "tenosynovitis." So vaguely is the word used that it has come to mean little more than a painful disability arising in or around a tendon or a group of tendons. The conditions giving rise to it are of uncertain pathology, and therefore more accurate terminology is hardly possible. The commonest, variously known as "non-suppurative tenosynovitis," "crepitant peritendinitis," or "non-specific tenosynovitis," can be quite disabling. It occurs most often in the region of the wrist, usually affecting the long extensor and abductor tendons of the thumb.

Tenosynovitis at the Wrist

In most cases such a tenosynovitis at the wrist starts fairly suddenly and often for no very obvious reason. The symptoms and signs are usually most marked over the radial side of the forearm just above the joint, where the tendons of the long extensor and of the abductor of the thumb come to lie on the radial side of the lower end of the forearm. All tendons which move either around corners or under ligaments are particularly susceptible to tenosynovitis, and on the radial side of the wrist the long thumb tendons cross over each other, and also move through a considerable range round a corner, in tough and unyielding sheaths. The occurrence of disorders caused or aggravated by friction is therefore very likely there.

Other tendons are not immune. The long flat tendons on the back of the hand move through loose areolar tissue (the paratenon), but they, too, have a considerable excursion and are liable to frictional troubles. In front of the wrist the flexor tendons are closely packed under the tight angular ligament, and move round a corner whenever the wrist is flexed or extended, so that they, too, are vulnerable.

It is hardly surprising that the commonest provoking cause of tenosynovitis is repeated unaccustomed movement, either an action the patient has never undertaken before or a familiar movement resumed after an interval. The type of action most likely to produce trouble at the wrist is a combination of gripping and of a twist of the forearm into pronation or supination, due as often to the use of scissors or shears as to the use of complicated hand-controls in machinery. The thumb tendons are especially affected by repeated full movements of the thumb and of the wrist together, as in picking up and laying bricks. The importance of newness of the action is seen in the fact that many patients start to have symptoms on the second day of taking up a new job or of resuming an old one after a holiday or an illness.

Occasionally the condition seems to be due to persistent repetition of some standardized movement which is neither new nor recently resumed, but which has been continued beyond the point of fatigue, especially after one particular strain which was of no great moment in itself. Tenosynovitis may occur in this way in the wrist of a golfer who has checked his stroke and gone on playing despite pain, or in the forearm of someone who has wrenched his flexor muscles in gripping the rail of a bus which has

started suddenly. An isolated injury or strain alone, however, is not a sufficient cause, and many of these patients can give no history of anything likely even to have contributed to the cause of their trouble.

Tenosynovitis Elsewhere

After the wrist, the ankle region is the commonest site for the occurrence of tenosynovitis. Newcomers to treadle work develop it around the tendons of the tibialis anterior or tibialis posterior, in front of or behind the medial malleolus. Recruits to marching get a similar "peritendinitis" higher up the leg. The Achilles tendon is sometimes affected, though less often, but with this tendon great care is necessary. One must beware of the diagnosis of Achilles "tenosynovitis" if symptoms start after a single strain such as a badly taken jump, for such "strains" are often incomplete ruptures of the tendon itself, which, if neglected, become complete all too easily. The Achilles tendon is, however, almost the only one in which such gradual rupture can mimic tenosynovitis, except that tenosynovitis in the region of the shoulder is often associated with complete or incomplete rupture of the tendon concerned, but the syndromes produced around that joint are very different from those of the lesions under discussion here.

Symptoms and Signs

The clinical features of tenosynovitis such as we are now considering are pain, swelling, and crepitus. The condition occurs only in adults.

Pain is the earliest symptom. At first it is produced only by movement of the affected tendon or tendons, but later it can become almost continuous, very tiresome in bed, and so greatly aggravated by movement that reflex muscle spasm is produced and a subacute arthritis simulated. *Swelling* remains localized if the condition is affecting tendons with a definite sheath, such as those immediately in front of or behind the wrist and the ankle. Where it affects the peritendinous tissue of tendons which have no sheath, the swelling is diffuse. Higher up the forearm, on the back of the hand, and in front of the leg above the ankle one does not, therefore, expect localized swelling. *Crepitus* always occurs after the swelling, and is often best felt proximally to the true tendon sheath, rather above the swelling. This is to be expected, for the swelling is due to fluid, and where an appreciable amount of fluid has accumulated there is not much friction and therefore little crepitus. At the wrist the crepitus is described as "leathery," and over the Achilles tendon as "silky."

Prognosis

The course of tenosynovitis is a little unpredictable. In cases involving the long tendons of the thumb symptoms may last for weeks. In any case and at any site treatment is imperative, as there is a strong tendency for untreated or badly treated cases to become chronic, with acute exacerbations every time the patients resume work. Correct treatment can certainly prevent this.

Treatment

At the wrist, whichever tendons are affected, the aim of treatment is *restriction* of movement. *Abolition* of movement (absolute rest) is harmful, for muscle wasting and

weakness result from this and make relapse more likely when work is resumed. Moreover, complete immobilization of the wrist, the thumb, and the fingers all at the same time does more harm than is often realized, for the stiffness may persist many weeks after the splint has been removed, and the treatment thus becomes more crippling than the disease.

The degree of immobilization required can be obtained by the use of strapping, or, better still, of a detachable splint which is removed once a day for full active movements without strain. The splint must, of course, be a well-fitting one, preferably made of a light waterproof plastic material. It must be made specially for the particular patient under treatment. Alternatively, a removable plaster cast will do, or even a complete plaster if it does not include the digits. The wrist may be fixed, but the fingers must not be immobilized. Strapping, if used instead of a splint, is satisfactory if it is generously applied. A whole roll of 3-in. (7.6-cm.) elastic adhesive strapping is needed for each case. It should be applied from the knuckles up to a short way below the elbow, leaving the digits quite uncovered. At least six thicknesses should be applied over the area of the swelling, and the strapping should be changed as soon as it becomes loose. Generous firm bandaging over wool is also satisfactory.

It is as well for a sling to be worn for the first two or three days only. Then it must be discarded, and the hand should be used as much as possible, with the splint on, of course.

Massage plays no part in the treatment of this condition. Neither heat nor cold applied to the surface helps at all. Counter-irritants are equally useless, but there is perhaps something to be gained from the use of short-wave diathermy as well as splintage.

In patients whose tenosynovitis dates from taking up a new job, the importance of training is to be stressed. This is particularly true in young soldiers with peritendinitis in the anterior compartment of the leg, for the very fact that they complain at all indicates that their morale is low and that their need is training, not treatment. Most people regard such symptoms as a trivial and transient penalty for unwonted exercise in boots, a penalty paid, indeed, by most inferiorly trained amateur footballers after the first game of any season. The only persons who complain much are those who are using such symptoms to express their dissatisfaction with their conditions of life.

Chronic Tenosynovitis

A properly treated tenosynovitis should be cured in three weeks. If symptoms persist despite correct treatment, investigation is necessary. Chronic tenosynovitis may have a serious significance, though this is not usual. The swollen tendon sheaths in serious diseases such as rheumatoid arthritis and the tuberculous "compound palmar ganglion" are not likely to present as a simple tenosynovitis in the first instance, and confusion with serious disease very seldom arises. The association with rheumatic disease is, however, close enough for one to recommend the use of salicylates in any case of tenosynovitis which has no very obvious cause and which is resisting treatment. Authors of textbooks made much of the associations between tenosynovitis and allergy or gonorrhoea. These impress us less than they did our fathers, but the association with gout is more important and may call for consideration. Oxaluria also may be a factor maintaining chronicity in some cases. Syphilis as a cause of chronic tenosynovitis is certainly uncommon and is probably usually missed.

Most chronic cases start quite differently from the usual non-specific tenosynovitis, and they tend to produce a different end-result. In time they develop either a persistent distension of the tendon sheaths with fluid or a nodular or fibro-fatty enlargement of the sheaths. The first type of chronic disorder often gives the patient surprisingly little trouble.

Tuberculous Tenosynovitis.—The suspicion of tuberculosis can arise in any chronic case. Tuberculous tenosynovitis is, however, insidious and relatively painless in its onset. In contrast with the non-specific type we have been considering it favours flexors rather than extensors at the wrist, and, though extensors are not immune, the characteristic lesion of this disease is the compound palmar ganglion. At the ankle, tuberculosis favours the peroneals and the extensors of the toes rather than the tendons on the medial side of the joint. Tuberculosis of tendon sheaths is, of course, always blood-spread and an active focus is present and can often be found elsewhere in the body. The tendon-sheath disease usually produces enlargement of the regional lymph nodes by the time the patient seeks advice. Tuberculosis is, however, always a deceptive disease, and if real doubt exists it would be wise to make a biopsy of the lymph nodes or of the tendon sheath itself.

Tenosynovitis and Rheumatism.—Chronic tenosynovitis of the Achilles tendon, with swelling extending often visibly some distance up the tendon, is to be watched carefully. It is often an early indication of an otherwise unsuspected rheumatoid arthritis. Any nodular thickening beneath the tendon, in the region of the Achilles bursa, is especially suspect. The patient must be carefully questioned about swelling or pain in any other joint. Simple, non-rheumatic cases of tenosynovitis in this region respond well to elevation of the heel by $\frac{1}{2}$ or $\frac{3}{4}$ in. (1.3 to 1.9 cm.), firm strapping of the affected area, and the removal of the stiffener from the back of the shoe, but, if the swelling persists despite this, a rheumatic background must be suspected.

Tendovaginitis: De Quervain's Disease

Tendovaginitis, in which the trouble lies in part at least in the fibrous tendon sheath and not in the inner synovial lining, is usually seen in one of two forms—as stenosing tendovaginitis or as trigger-finger or trigger-thumb. The first of these, stenosing tendovaginitis at the radial styloid (De Quervain's disease), is much commoner than is often thought. On the radial side of the wrist-joint, over the styloid process of the radius, two tendons lie in a shallow groove lateral to all the extensor tendons of the wrist and fingers. They are the tendons of abductor pollicis longus (extensor ossis metacarpi pollicis) and extensor pollicis brevis (extensor primi internodii pollicis). For $1\frac{1}{4}$ in. (3.1 cm.) over the lower end of the radius they are covered with a tough unyielding ligamentous sheath, from which they emerge at the level of the wrist-joint. The complicated movements which can be carried out simultaneously by the thumb and the wrist bend these tendons about to an unusual degree; it would appear that friction can produce at the same time a thickening of the tendon in the sheath, a reaction in the synovial lining, and a variable degree of thickening of the tough fibrous sheath itself, which becomes thickened as much internally as externally. A thick tendon in a thick sheath moves even less freely than ever, and pain is produced.

This condition, described by De Quervain, a pupil of the great Theodor Kocher, occurs only in adults. It is much commoner in women than in men. The pain may radiate widely, down the hand and up the arm, even to the shoulder. It is made worse by "straightening the thumb" (abducting the thumb) against any resistance, and especially by pulling the hand over to the ulnar side or by twisting the wrist so that the affected tendons are pulled at an angle to the sheath.

The one outstanding physical sign is localized tenderness just over the radial side of the lower end of the radius about $\frac{1}{2}$ in. (1.3 cm.) above the tip of the styloid process. This tenderness is usually pathognomonic, for the only condition which could produce similar localized tenderness would be a fracture of the base of the radial styloid, when there would be a completely different history. Diagnosis is therefore easy, and it is usually made even easier by the presence of a palpable and often visible swelling due to thickening of the sheath (Fig. 1).

Treatment is as easy as diagnosis. If the tendon sheath is opened at the point of tenderness and slit open over its full length of about $\frac{1}{2}$ or 1 in. (1.3 or 2.5 cm.), cure is certain. The amount of thickening in the sheath often surprises the operator, but once the sheath has been completely divided it opens enough to allow the tendons free movement and

FIG. 1.—Stenosing tendovaginitis at the radial styloid (De Quervain). The drawing shows the position and the size of the swelling in a rather severe case.

plenty of room. The only things which can lead to a poor result are bad surgery or abnormal anatomy. The operation must be done under a general anaesthetic so that a pneumatic tourniquet may be used to give a bloodless field, for the surgeon can then make a precise job of what he is doing. He can certainly avoid the terminal branches of the radial nerve, which lie in the field and which can cause great pain if they are included in a stitch.

There is no reliable conservative treatment. Those who refuse operation can be cured by time, but it takes a long time. They are usually subjected to many weeks or months of plaster-of-Paris splintage or strapping, or both, but the credit for cure should be given to time. Operation, on the other hand, gives cure which is both immediate and certain.

Trigger-finger

Tendovaginitis over the palmar aspects of the metacarpal heads can produce a rather similar but much more dramatic syndrome—a "trigger-finger" or "trigger-thumb." This disability is due to a thickening of the tendon rather than of the sheath; the title "tendovaginitis" is really quite incorrect. Some swelling of the affected tendons is usual in the disorder at the radial styloid already described, but in the lesion found over the metacarpal heads the thickening is localized as a well-marked nodule which is big enough to get trapped in a practically normal tendon sheath. The nodule develops in one or both flexor tendons just where these tendons enter the finger. The powerful flexor muscles can usually pull it through the sheath quite easily, but when they relax it is found that the extensor mechanism is not strong enough to pull the nodule through the sheath in the reverse direction. This means that the finger stays flexed (Fig. 2) until considerable force is

FIG. 2.—Trigger-finger. The position in which the finger is locked.

FIG. 3.—Trigger-finger due to rupture of the extensor expansion. Note the very different position of locking from that in Fig. 2.

applied, usually with the other hand or by another person. A determined passive pull will be found to overcome resistance with a considerable snap, after which the finger extends fully and easily. The snap or click and the sudden free movement which follows it have earned the name "trigger-finger." In really severe cases flexion may be blocked in addition to extension, the finger being locked

in a semiflexed position from which it can be moved only by passive force strong enough to produce the characteristic click.

The only diagnostic difficulty lies in recognizing that the obstruction lies on the palmar side of the finger, anterior to the metacarpal head. The patient often insists that the click is on the back of the finger, and, as extension is the movement usually blocked, the doctor sometimes seeks for an explanation on the extensor side of the affected finger. This difficulty should not arise, for the nodular thickening of the flexor tendon produces a lump which can be felt very easily in the palm just proximal to the base of the finger.

There is one type of trigger-finger in which the lesion does lie on the back of the digit. This consists in an avulsion of the middle slip of the extensor expansion from the back of the base of the middle phalanx. This is much less common than the flexor tendon variety, it never affects the thumb, it follows a well-remembered injury, and it produces a completely different disability (Fig. 3). The sufferer from this lesion has difficulty in keeping the finger fully extended at the proximal interphalangeal joint, and when he flexes the finger (not when he extends it) there is a snap as the two lateral slips of the extensor expansion jerk sideways over the head of the proximal phalanx. There is, of course, no lump.

Trigger-thumb

Trigger-thumb is much commoner in infants than in adults. It is the only one of all these disabilities which ever occurs in children. The mother notices that the baby's thumb or thumbs cannot be extended beyond about 150 degrees without a pull, a jerk, and a click. Often the thumb cannot be flexed without a similar jerk. The thumb is held flexed into the palm, sometimes apparently completely locked, and the mother fears that the use of the thumb will be impaired for ever. The pathology is the same as in trigger-finger, and a considerable lump is always palpable in the flexor tendon of the thumb just in front of the first metacarpal head.

Treatment of Trigger-finger and Trigger-thumb

Again, the only reliable treatment is by a small operation which gives an immediate, certain, and permanent cure. The tendon sheath is exposed through a transverse skin incision (Fig. 4) in the line of the appropriate skin crease in the palm or at the base of the thumb. The exposed sheath is then slit longitudinally (preferably to one side of its midline), the nodule exposed (Fig. 5), the finger moved, and freedom of movement demonstrated. Only the skin should be sutured. This operation is better done under a local analgesic so that the patient can move the finger actively while the wound is open, thus demonstrating the completeness of cure or the need for further slitting of the sheath. In very small babies the operation may safely be postponed, but there is no reason why it should not be done before the second birthday. A local analgesic is hardly suitable for such patients, however.

My thanks are due to Miss J. Perry for the diagrams.

Next Refresher Course Article.—"Empyema," by Mr. T. Holmes Sellors.

METABOLIC AND RADIO-ISOTOPE WORK AT UNIVERSITY COLLEGE HOSPITAL

The old children's ward at University College Hospital, London, W.C.1, has just been converted into a special ward for the study of metabolic disorders and the use of radio-isotopes in treatment. It includes in compact design two three-bedded rooms and two singles, a special diet kitchen, chemical laboratories for balance studies and for research, and a neatly planned isotope laboratory, with a "cellar" and observation-room, chiefly used for the treatment of histologically differentiated thyroid carcinoma, especially after thyroidectomy. Some views, of this are shown below. The conversion has cost about £12,000, which the hospital has found from its special funds, with the help of a legacy of £5,000 from a former student, John Stothert.

FIG. 1.—Concentrated radio-iodide from Harwell, inside the lead cylinder by the operator's left hand, is diluted for the patient's dose by remotely controlled pipette (left) and burette (right), the operator wearing rubber gloves, and working at a distance of one foot behind lead bricks. Note the ventilation hood above, and the trolley on the railway at the back of the bench.

FIG. 2.—The patient sucks the dose of isotope from a flask inside a thick lead cylinder carried on the trolley of the remotely controlled railway. Note the protective lead bricks (some have been removed for the photograph) and the ventilation grille and shaft above the patient near the ceiling.

FIG. 3.—Following the distribution of radio-iodine in the patient, while a Geiger counter is moved slowly over her on the rails, either by hand, or by a motor at a steady 10 cm. a minute.

FIG. 4.—Her urine, strongly radioactive for about a week, is collected in her own Winchester kept in a lead-lined cupboard (left) with doors both into the laboratory and into the ward corridor. Filled bottles are moved with tongs to the lift, which takes them to the "cellar" below. Safe urine is poured down the funnel left of the sink, and runs into the tank in the cellar.

FIG. 5.—The cellar lined with lead bins in which some Winchesters of urine must be stored for two months, until their radioactivity has decayed to a safe level. They are then poured down the funnel let into the bench to the tank underneath, emptying slowly into the hospital sewage, with monitoring of the daily discharge.

EARLY TREATMENT OF POLIOMYELITIS

BY

G. P. MITCHELL, M.C., M.B., F.R.C.S.Ed.

*Late Resident Surgical Officer, Wingfield-Morris
Orthopaedic Hospital, Oxford*

(From the Nuffield Orthopaedic Centre, Oxford)

Poliomyelitis in this country did not assume epidemic proportions until 1947. Experience since then seems to indicate a greater endemicity than in the past, with a greater liability to seasonal epidemics in various areas.

To ensure good treatment and to obtain accurate information from a relatively small number of cases, it is essential that the care of the patients be delegated to a team composed of members from all branches of the profession interested in the condition. Such a team ensures an organization capable of expansion in the event of a large epidemic.

It is usually the custom in this country for acute poliomyelitis cases to be admitted initially to isolation hospitals and subsequently transferred to orthopaedic hospitals for treatment of the convalescent and chronic stages. Co-operation between the staffs of these hospitals is essential to a comprehensive plan of treatment.

Since 1947, in the Oxford area, the treatment of poliomyelitis has been so arranged that continuity is obtained from the onset of the disease through the isolation and orthopaedic hospital stage to the final assessment and treatment of the residual paralysis. It is the purpose of this paper to describe the present organization, and to emphasize several important points of treatment in the early stage.

Organization in the Oxford Area

In Oxford the aim is to bring together the staff of the fever hospitals and the Wingfield-Morris Orthopaedic Hospital, and at the same time enrol those from other branches of the profession with special experience or interest in the disease. The poliomyelitis team includes the M.O.H., the medical staff of the fever hospitals, a neurologist, and a specialist in virus diseases. The patients are admitted to the fever hospital. A member of the staff of the orthopaedic hospital is notified, and he visits the patient in consultation with the staff of the isolation hospital. After three weeks patients with severe residual paralysis are transferred to the orthopaedic hospital, while those with a minor degree of paralysis are discharged and arrangements made for their follow-up at orthopaedic clinics in the area.

A member of the staff of the orthopaedic hospital is responsible for the orthopaedic treatment from the onset, and he works in close co-operation with the medical and nursing staff, who actually carry out the treatment. In addition to arranging admission of paralytic cases to the long-stay hospital, the orthopaedic surgeon helps in the diagnosis of cases suffering from other complaints which are sent in as poliomyelitis during an epidemic; we have come across tuberculosis, osteomyelitis, "observation hips," and other orthopaedic conditions. The orthopaedic surgeon visiting the fever hospitals is responsible for ensuring that early deformities are mitigated, and he has recourse to other members of the team for advice when required. At the end of the poliomyelitis season he reports to the team on any problems encountered and brings forward suggestions for future epidemics.

Every year a demonstration of the respirator is arranged for nurses and housemen, and there are informal talks and discussions to which all members of the team are invited.

Treatment in the Fever Hospital

Apart from consideration of the infectious period, the three weeks' stay in the fever hospital which is customary at present is of the greatest value and should not be reduced. The patient has time to get over the painful irritable stage and can begin to adjust his mind to the future before being transferred to another hospital.

The psychological aspect of the disease is given special consideration by the fever hospital staff, medical and nursing, and even the orthopaedic surgeon can help by assuring the patient that an interest will be taken in resettling him when finally discharged. It is of the utmost importance that from the very onset of the disease the patient should be as relaxed and confident as possible in the circumstances. Patients obtain comfort in the knowledge that they are already being supervised by a member of the staff of the hospital in which they may spend a considerable time when the acute stage is past. This appreciation has often been expressed.

Such continuity is important with respirator patients, who are naturally disturbed by a change of hospital, and extra visits to such patients are well worth while, as the greater their confidence the easier it is to overcome the psychological difficulties associated with removing them from the respirator.

General Nursing Care

The patient in the acute stage is admitted to the fever hospital under the physician in charge, who carries out an approximate estimation of what muscles are affected. Extensive muscle-testing should not be done in the first few days. Problems of respiration, bulbar paralysis, urine retention, and general nursing are dealt with. Urine retention not responding to simple measures is treated by intermittent catheterization. In our patients no difficulty has been experienced in restoring bladder function in a few days, but in some cases bladder function may be abnormal for weeks or months.

The patient is nursed in a quiet cubicle, sedation by phenobarbitone is instituted, and codeine is given for pain. In the first few days the patient is often restless, and tends to change position frequently in order to gain relief from lumbar pain. In patients who cannot move, lumbar pain can sometimes be eased by placing a soft pillow under the lumbar spine for an hour at a time—if left longer the pain is apt to return. No elaborate positioning of affected limbs is attempted at this stage, apart from a foot-board and soft pillows supporting knees and arms. It is our aim to disturb the patient as little as possible.

Examination and Assessment

The orthopaedic surgeon is notified by telephone of the case and its approximate severity, and problems such as a tendency to overaction of a muscle group are reported. If there is any serious problem he visits the patient immediately, otherwise he waits until the fever has subsided and the patient is more co-operative. Young children should be visited early in the day, as they are unresponsive and difficult to assess when they are tired.

The patient is examined as fully as is necessary to obtain a reasonably comprehensive muscle chart, note being taken of any limitation of joint movement, neck stiffness, limitation of straight leg raising, and especially any tendency for a muscle to overact. On no account should a complete examination be made: minor errors in charting are preferable to the exhausting of muscles and patient. Muscle charts can be completed at subsequent examinations. After assessment, treatment is ordered.

Positioning and Passive Movement of Limbs

Limbs and spine are so positioned as to relax paralysed muscles and prevent the development of any overacting tendency in active muscles.

Spine.—If the bed and mattress are in good condition no fracture boards are used, as in some cases they aggravate the lumbar ache. The patient is allowed to roll on the side; frequent changes of position, and periods in the prone position, tend to ease back stiffness and pain in the early stage.

Lower Limbs.—The knees are supported by one pillow and the feet by a foot-board. When indicated, plaster back-

FIG. 1.—Method of suspension by felt sling from overhead beam. Use of bandage roll in maintaining thumb opposition is shown.

FIG. 2.—Improvisation of overhead beam using bed screen and cross-bar.

splints are used to control rotation or inequality of the leg muscles. The ankle is positioned according to the power of the muscles, but usually at a few degrees below the right angle, or more where there is gross weakness of the calf muscles.

Upper Limbs.—With paralysis above the elbow, the position is maintained by a broad felt sling under the elbow suspended from an overhead beam (Figs. 1 and 2). The shoulders are maintained at 75 degrees of abduction and

the elbow at 90 degrees of flexion; the wrist and hand are placed in the position of rest at the outlet of the felt. The thumb is maintained in opposition either by a suitably placed opening in the felt or by a roll of bandage in the palm. This method is comfortable for the patient, maintains accurately any position required, and is easily altered when it is desired to change position. Passive movements can be carried out with the minimal disturbance. The slight flexion of the hand at the outlet of the felt prevents hyper-extension deformity at the metacarpo-phalangeal joints and usually removes the need for additional splintage in the early stage.

Passive Joint Movement.—After the fever has subsided all joints are moved through a passive range twice daily, but the range must not be sufficient to cause pain or muscle resistance. Daily joint movement also ensures that early muscle resistance and tendency to deformity are reported to the orthopaedic surgeon at their onset.

Hot Packs

The over-zealous application of hot packs is exhausting to the patient mentally as well as physically. They are used only if there is persistent muscular tenderness or pain, and are applied to the painful areas and not to all the paralysed parts. Packs are renewed during a 20-minute period; this period is repeated according to the benefit obtained. Their use for a period just before sleep ensures a restful night. After the febrile stage children derive great comfort from immersion in an ordinary hot bath.

Summary and Conclusions

The organization which exists in Oxford for the treatment of poliomyelitis in the early stage is described. Co-operation between the staff of the fever hospitals and the orthopaedic centre ensures continual supervision of the patient through all stages of the disease.

Important aspects of treatment in the fever hospital are: general nursing care and sedation; examination and assessment; positioning and passive movement of limbs; hot packs.

The scheme of treatment described is designed to rest paralysed muscles and to prevent and overcome any tendency to early deformity likely to interfere with the patient's future activities.

This regime, when applied in the early stage of the disease, will usually overcome "muscle spasm" and consequent deforming tendencies by the time the patient leaves the fever hospital. When necessary the positioning should be continued after admission to the orthopaedic hospital.

Some patients have had little or no treatment in the early months of the disease, and in a proportion of these deformities due to abnormal overaction of muscle groups have been established. Deforming tendencies appearing in the early weeks of the disease must therefore be recognized and treated, and an attempt made to understand them.

At the Devon and Exeter Medico-Chirurgical Society on March 6 Dr. M. C. Binnie spoke of geriatrics, its scope and problems. He said that geriatrics should be regarded more as an outlook than as a specialty. Its outstanding contribution so far was its insistence on early activity. Contractures, bed-sores, incontinence, pulmonary emboli, and aspiration pneumonia were some of the sequelae of too prolonged a rest in bed. Cases of coronary thrombosis or congestive failure in the aged should be confined to bed for about half the time required by a younger person. Even before he got up much could be done for the elderly patient by simple physiotherapy. All who dealt with him should be encouraged to keep this principle of mobility constantly in mind. Next in importance came rehabilitation of body and mind. Occupational therapy, especially of a diversional type, could do much towards this end.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

Anoxia in Sleep

SIR,—The anoxia found in deep sleep is not its cause, but the result of immobility, which slackens the circulation by removing the pumping action of the muscles which in activity reinforce the action of the heart.—I am, etc.,

Lowestoft.

LEONARD HILL.

Coronary Disease in Doctors

SIR,—Lest the medical profession might be somewhat depressed by your leading article of March 8 (p. 535) showing the increasing incidence of early deaths in the profession from coronary thrombosis, we have analysed the ages at death of the 30 doctors in your obituary column (p. 557) of the same date. Of the 13 doctors whose ages are given, the average age at death was 76.7 years. Of the remaining 17, taking the date of qualification from the *Medical Register* and assuming that the average age to qualify was 22, the average age at death was 69.2 years, giving an overall average of 72.43 years, which goes to show that the doctor is still attaining his allotted span.—We are, etc.,

D. C. PIM.

Leeds.

J. E. OUTHWAITE.

SIR,—In your leading article on coronary disease in doctors (March 8, p. 535) you draw attention to the apparent absence of any increased incidence of this complaint during the war years 1940–6, but that there was such an increase in 1947–50.

This seems to puzzle the investigators—but why should it? In a complaint of this nature there must be a considerable time-lag between the beginning of the disease and any manifestations.

I would say that the increase in 1947–50 is exactly what one would expect, the disease having originated during the war, with its abnormal stress and strain, three to five years previously to causing symptoms.—I am, etc.,

Bedford.

F. K. HAYMAN.

SIR,—The figures and facts given by Dr. J. N. Morris and his colleagues (March 8, p. 503) confirm everyday medical experience that patients with coronary atheroma are liable to die suddenly, but one was not prepared to find that "60% of the total coronary mortality represented deaths occurring very quickly in the first few days of the first clinical attack." In my private practice, sudden death—i.e., death within 24 hours of a heart attack—occurred in 19 patients, and death within one week in another seven. The previous history was unknown in 4 of these 26 cases (five of them female); 12 had previous cardiac infarction, seven had angina with an abnormal cardiogram which, in most, showed cardiac infarction, and one had aortic stenosis. Sudden death without previous symptoms or signs of heart disease occurred in only two cases, and one of these had an abnormal cardiogram before onset of the fatal illness. These figures suggest that sudden death "in the first clinical attack" is exceptional. Cardiac infarction may come on slowly, and may take place with no more symptoms than mild indigestion, so that the diagnosis is made some time after infarction has occurred and no treatment is given. For this reason, eight of my patients were never off work for heart disease before they died. In actuarial records they died in the first clinical attack, in medical records they were known as patients with heart disease.—I am, etc.,

London, W.1.

PETER MEYER.

Herpes Zoster and Varicella

SIR,—With regard to the concise study of herpes zoster varicellousus by Dr. D. I. McCallum (March 8, p. 520) I feel sure that the author had no doubt that a single virus accounted for the spectacular group of cases which followed Case 6.

Surely by now there is enough evidence for us to accept the view that zoster and varicella are due to a single virus which shows dermatropic and neurotropic modifications. In 1933 some of my cross-complement fixation reactions were so sharp and specific, while the controls were negative, that I had no doubt that the viruses were identical or very closely related. Many workers have confirmed these observations, and it is easy to explain the smaller group of negative findings by the variability in the amount of antigen present in the vesicles. Rake *et al.* (*J. Bact.*, 1948, **56**, 293) found that the elementary bodies of zoster were most plentiful in vesicles 12 hours after their eruption, while in 24 hours or later the elementary bodies were scanty. This fact, and the variability of dilution of the antigen which depends upon the amount of exudation, probably accounts for a good deal of the variability in the antigen content of the vesicles. Again, specific antibodies do not appear until about two weeks after the eruption, so that specimens of serum obtained earlier than this may give no reaction with the antigen. Amias and others have demonstrated the agglutination of virus particles from zoster vesicles with convalescent zoster or varicella sera. Rake *et al.* described an epidemic of varicella apparently initiated by a case of zoster, and stated the well-known fact that a vast number of similar cases have now been reported in the literature. These authors were able to demonstrate that typical and similar elementary bodies were found in the vesicles of the original case of zoster and in the secondary cases of varicella, and they conclude that one can hardly doubt that, in this instance, both diseases were produced by the same virus.

Is it surprising that occasionally the neurotropic modification of the common virus may be more stable and give rise to a small epidemic of zoster cases in contacts, when we remember the extremely stable modification of variola virus which we know as vaccinia? In my opinion the neurotropic and dermatropic modifications of the common virus of zoster and varicella account satisfactorily for all the known clinical phenomena, and I believe the acceptance of this established fact is overdue.—I am, etc.,

London, W.1.

R. T. BRAIN.

Effect of Reading on Cataract

SIR,—Mr. Victor Purvis's letter (March 1, p. 490) raises an important question whether reading has any influence on the progress of cataract.

Doctors have an unenviable reputation for curtailing the activities of those who seek their aid. Restriction of close work, and, the mainstay of the optician, the frequent correction of refractive errors, have for long been held important in cataract and myopia: it is doubtful whether either has the slightest influence. To forbid reading in early cataract may well deny the only solace of the aged, and there is much to be said for the view that clerical work is the most suitable for the myope. One should be on sure ground before interfering with these occupations. It is surprising, therefore, to find (February 9, p. 318) one of Mr. John Foster's enlightened outlook maintaining this tradition, and it is a matter of concern that it should be in so widely read an article unless there is good evidence to support it. If so, let it at last be put before us.—I am, etc.,

Redruth.

CHRISTOPHER HEATH.

The Anatomy Act

SIR,—It is pleasing to read the letter from the President of the Royal College of Surgeons of England (March 8, p. 544) commending the proposal to alter the law to authorize the establishment and maintenance of eye banks for corneal graft surgery.

For some time now we have been aware of the legal difficulties confronting ophthalmic surgeons wishing to collect and store donated material, and their dependence on the use of pathological eyes taken from living subjects. The provisions of the Anatomy Act place serious obstacles in the way of collecting material from persons who have just died, and I understand that unless the material is collected within a short time of the death of a patient it is valueless for use in ophthalmic surgery.

There are maintained in this country other banks of which the legality is seriously in doubt because of the restrictions imposed by the old Anatomy Act on the collection and storage of material for ready use in the treatment of bone and other conditions. From information I hold it is not unlikely that there will soon be a demand for the collection and storage of soft tissues—e.g., fascia, arteries, and veins.

The Anatomy Act was originally designed to meet a special set of circumstances arising from the activities of the "Resurrectionists." Their re-emergence is highly improbable, and the law should be suitably amended to permit surgeons and pathologists to collect material for treatment, for research, and for tuition in medical and postgraduate schools. The time appears to be appropriate not only for a minor change in the law but for a review of the Anatomy Act as a whole to eliminate its restrictions on treatment and pathological investigation, and to amend the provisions which may hinder surgical progress promised now or in the future.—I am, etc.,

London, W.C.1.

ROBERT FORBES.

Bacteriological Warfare in Korea

SIR,—Many medical men and women must feel grave disquiet at the allegations by the Chinese Government that the U.S. armed forces have sent missiles containing disease-contaminated insects into the North Korean lines and into Chinese Manchuria; it is claimed that the diseases spread thereby include plague and that specimens of the containers can be produced. The accusations have been firmly denied, and it is natural for us in the West (though perhaps less easy for people in Asia) to accept this assurance and to assume that the allegations are a cover for spontaneous epidemics, etc. It is, however, freely admitted that research in biological warfare is proceeding (*Peace or Pestilence*, by T. Rosebury (New York, 1949)), and it is not impossible that the present situation might be regarded by some extremists as suitable for testing its potentialities. In the International Code of Medical Ethics adopted in 1949 by the Third General Assembly of the World Medical Association (of which the B.M.A. is a member), it is laid down that "under no circumstances is a doctor permitted to do anything that would weaken the physical or mental resistance of a human being, except from strictly therapeutic or prophylactic indications imposed in the interest of the patient." If such a pledge is to be more than a pious platitude we cannot be satisfied with denials, however much confidence we place in them, of accusations that medical research has been applied for grossly unethical purposes; the present grave allegations should be directly investigated on the spot by a neutral commission of inquiry. This is all the more vital because, in the broader aspect, this pattern of accusation, denial, and counter-accusation could be a dangerous precedent for the first use by any nation of any new weapon repulsive to public opinion. The situation also makes consideration urgently necessary of the plea of the Medical Association for the Prevention of War for international agreement on repudiation of the use of biological warfare as an offensive weapon, coupled with effective methods of control (*Lancet*, February 2, p. 258).—I am, etc.,

London, N.W.3.

P. D'ARCY HART.

* The International Red Cross offered on March 13 to send a neutral commission to Korea to investigate allegations of bacteriological warfare.—Ed., B.M.J.

Experiment in Peacemaking

SIR,—I was much interested in the letter of Dr. R. L. Kitching (March 8, p. 548) in regard to the role that the medical profession can play in the maintenance of peace.

Throughout the Western and particularly in the Eastern worlds there are millions of people receptive to Stalinistic propaganda. These peoples are primarily receptive because of their living conditions.

Even allowing for every death, there will be 25 million more people by this time next year. Although 75% will die at an average age of 30, they will make the world population amount to 3 thousand million. With the assistance of chemotherapy, vaccines, and public health units, doctors are invading war-ravaged and poorly developed countries, and producing unfortunate results. In Japan the death rate was cut by half, and then the birth rate jumped from 23 to 34 per thousand. In 20 years Japan's population will be over a hundred million. Similar figures can be cited for many other countries, such as India, Egypt, and certain islands, such as Puerto Rico. Instead of improving conditions, by increasing the birth rate and reducing the death rate they are continually deteriorating.

Some method of achieving control of the world population must be worked out soon. Recent experiments show that medical science will be able to produce some form of tablet contraceptive that can be used by the simplest people. It must be admitted the situation is complex, with many ethical and religious facets, but I feel it must be tackled if world peace is to have any permanency.

—I am, etc.,

Birmingham.

R. SOMERVILLE LAMBIE.

SIR,—May I congratulate Dr. R. L. Kitching on his brilliant letters (December 1, 1951, p. 1337, and March 8, p. 548) concerning his suggested experiment in peacemaking and you for publishing them. What he has said is, I am convinced, what has been felt by the inarticulate millions who despair of the news in the daily papers. We are told that air raid sirens are to be provided in every town (but no shelters), so that presumably we are to be given a few moments in which to say our prayers before being blown into oblivion. It is insisted that war is not inevitable, yet our standard of living is being crippled to provide for it. Exhortations are made that we should join in civil defence "in case war comes," yet most of us have read John Hersey's book and know how futile the whole ghastly business will be. The statesmen on both sides argue and argue and never make any progress, whereas the people of every nation crave for peace and dread the shadow which creeps forward imperceptibly to darken their lives.

Surely it is time we recognized that there are national diseases as well as individual ones. Wars are national psychoses due to fear, and once the fear has reached sufficient pitch reason departs and delusional processes control all thinking. Part of this has already occurred, so that the word "peace" itself is suspect and anyone who belongs to an organization urging peace is already in danger of being put under surveillance. No doubt Dr. Kitching himself would find it difficult to gain entry into some countries because he has urged the need for peace.

Yet it is imperative, as Dr. Kitching states, that the people themselves should try to make contact with each other and dispel the fear of war which the politicians seem to breed and broadcast. It is this fear of war which makes such a large element in Italy and France become communistic. Surely we have sufficient to do to control disease without fighting each other. Let us therefore take up Dr. Kitching's suggestion to invite doctors of opposing nations to visit us, and raise a storm of protest if anyone dares to forbid their entry. If they will come, let us entertain them and discuss medical matters. Then they can go home and tell their nations that the people they met are human like themselves and not blood-stained monsters as they have been told. We may not have much success at first, but at least we shall have made a start. We shall not be like Anatole France's physician, who never interfered with the progress of a disease but found it of great interest to watch its progress until the patient died. In war we are the patient, but we may not find our own destruction so interesting.

—I am, etc.,

London, W.1.

CLIFFORD ALLEN.

Urolucosil*

A SULPHONAMIDE

FREE FROM SIDE-EFFECTS

One of the most valuable characteristics of Urolucosil is the remarkable absence of side-effects noted with this sulphonamide. Such conditions as cyanosis, vomiting, acidosis, hypersensitivity, have yet to be reported; it is most uncommon for there to be any upset of the blood picture or disturbance of the intestinal flora with Urolucosil. Because Urolucosil is a compound with the high solubility of 98% at a pH of 7, it is unlikely that any blockage of the urinary passage by crystalline deposits will be caused; no diminishing of urinary output caused by such blockage has in fact been reported since Urolucosil was introduced to the medical profession in Great Britain. Finally, depression, which so often militates against the well-being of a patient, is virtually absent when Urolucosil is prescribed. Urolucosil is especially indicated in uncomplicated infections due to *B. coli* and other organisms of the coliform group: acute cystitis, acute pyelitis, pyelitis of pregnancy: urinary tract infections in children: neurogenic bladder.

Each tablet of 0.1G contains:
2-sulphanilamido-5 methyl-1-thio-3: 4-diazole.

Urolucosil

Chewing Gum *simplifies the treatment*

Prolonged local medication against penicillin-sensitive organisms, within the buccal cavity, is attained, easily and effectively, by the use of Chulin (Penicillin Chewing Gum A & H). The penicillin, incorporated in a new, improved and palatable mint-flavoured base, is brought into intimate contact with infected surfaces, providing an effective concentration of penicillin in the mouth for three to four hours.

Chulin is the simplest way of treating Vincent's infection, tonsillitis, pyorrhœa and other oral infections due to penicillin-sensitive organisms.

One day's effective local penicillin therapy with 3 pieces

The Cleft in Man

SIR,—It is not often that the *British Medical Journal* bestows the hospitality of a full page of its valuable space on the review of a book (December 15, 1951, p. 1445). Impressed by this fact and by Professor Lancelot Hogben's interesting critique, in common no doubt with many others I have read the book, Dr. J. Bronowski's *The Common Sense of Science*, and would be glad to be allowed to comment on it.

In the last chapter Dr. Bronowski takes up the question of science the destroyer, and the indictments which have been brought against scientists for their alleged unthinking and amoral attitude as they go on inventing more and more destructive weapons. He remarks upon the fear of war that has developed, the war of nerves, and the important fact that there seems to be no generally accepted code of values capable of helping to deal with this situation. He offers a solution, however. He believes science can create these values, and states: "The first thing to do, it seems to me, is to treat this as a scientific question; by which I mean as a practical and sensible question, which deserves a factual approach and reasoned answer."

At this point his scientific training appears to desert him completely. He speaks of the cleft in man which two wars have uncovered—between the endeavour to be man and the relish in being brute—and, curiously to my mind, refers to it as a spiritual problem and not a psychological one. Later he asks: "Can science heal that neurotic [*sic*] flaw in us?" and adds that, if science cannot, then nothing can. And how will these very significant values be discovered and the cleft healed? The answer is: "Precisely as literature does, by looking into the human personality, by discovering what divides it and what cements it." That is how, he says, great writers have explored man in the past and that is how Dr. Bronowski believes this scientific problem, so important to us all, should be dealt with in the future. There is no suggestion that the problem may be a psychological one, and apparently a complete absence of awareness that a solution may be found through a scientific psychology or psychiatry. One is left pondering, after this incredible anticlimax with which the book ends, whether it is meant as an example of the common sense Dr. Bronowski is so interested in. As a psychiatrist, and after due consideration, I feel bound to say that it can be described more accurately in another way.—I am, etc.,

London, W.1.

FREDERICK DILLON.

Laryngeal Epilepsy

SIR,—Dr. W. Raymond Parkes (September 15, 1951, p. 672) and Dr. Douglas K. Adams (December 1, 1951, p. 1340) suggest that this condition is more likely to be seen or heard of by the doctor than by the specialist. In more than 20 years of general practice I have not actually seen one attack, though I have been credibly informed of some twoscore or so. The name is unfortunate. I have not recognized the condition in an epileptic, though even if it occurred it would be mistaken by the patient for his usual fit. I prefer the name "laryngeal vertigo," or even "cough swoon."

We had a small epidemic of this condition in Bradford in the spring of 1940 or 1941. Those who suffered from it at that time have not shown any tendency to recurrence or indeed to any unfortunate sequel. Most winters bring a case or two. The typical case usually presents a rigid thoracic cage, good muscular development, an irritating cough, tenacious sticky sputum, and some degree of impatience. The sequence of events as I see it is that in the first place some respiratory discomfort sets off a cough reflex, which does not relieve the tickle. Now follows a series of rather futile expiratory efforts through a closed glottis, until the position of full expiration is reached. If a sudden inspiratory movement is now attempted while the glottis is tightly closed and possibly stuck together with gummy sputum the pulmonary circulation is bound to retain all the venous blood reaching it, until some sort of

equilibrium is reached. The next stage is syncope, which almost at once causes relaxation of the laryngeal and inspiratory muscles, and the patient gets up from the floor or pavement convinced that his heart is bad. He is usually reassured when it is pointed out to him that a heart which will stand all this abuse and start working again must be a very good one to have.

It is interesting to notice that the swoon only happens when the patient is erect—probably because in that position the weight of the abdominal organs assists the sudden and violent inspiratory effort.

These attacks are rather rare and evanescent. It is most unlikely that any doctor will see many attacks, but I agree that students should be taught to recognize the condition from a description given by the patient.

At present I cannot find it mentioned in any of my books on medicine. Possibly the indexes are incomplete. My experience suggests that a cough swoon is more alarming than dangerous, unless of course it happens when the cougher is crossing a busy road. However, a patient of mine did even this with impunity once, but does not intend to tempt Providence again if he can help it.—I am, etc.,

Wrose, Shipley.

HENRY STEWART RUSSELL.

Unsuspected Gangrenous Appendix

SIR,—I consider that the following case history is worth publishing because certain features are evident which give invaluable help not only to the average general practitioner but more especially to the newly qualified house-surgeon, who because of lack of experience may be apt to be unenlightened on the possibilities of some of these features.

The mother of a young girl aged 7 was worried about her child because she frequently became listless and ill-looking but without any other signs or symptoms except for a daily rise in temperature varying between 99° F. and 100° F. (37.2° C. and 37.8° C.).

This state of affairs continued for many weeks, during which time the patient was subjected to various tests. The Paul-Bunnell test was negative. The agglutination tests of the typhoid and paratyphoid group were negative. Lung fields were clear. The urine contained only a faint trace of protein as a possible abnormality. Blood count: W.B.C.s 11,000 per c.mm. (48% polymorphs, 47% lymphocytes, and 2% monocytes). The E.N.T. specialist could find no upper respiratory infection.

The child continued to be "off form" for some more weeks until I was called to see her because she had been vomiting and had a higher temperature. On examination she did not appear unduly ill. There was no localized area of tenderness or pain in the abdomen, which was doughy all over on palpation. Since a certain amount of influenzal gastritis was prevalent at the time this was considered a possibility and she was treated accordingly.

At the next visit 48 hours later she complained of more vomiting in the interval, with pain in the abdomen only with movement. Palpation gave some increased discomfort in the right inguinal fossa. The urine was pink in colour and very opaque. The temperature was 98° F. (36.7° C.) and the pulse 100 per minute. Her mother said that the temperature had been 101° F. (38.3° C.) in the morning.

She was transferred to hospital and later operated upon, and was found to have had a perforated gangrenous appendix with generalized peritonitis.

The points to be appreciated in this case are: (1) The signs and symptoms being negligible in comparison to the true state of affairs. (2) The possibility of a normal temperature and pulse co-existing with a gangrenous appendix. (3) The possibility of the red herring of the urinary system being thought culpable.

The patient at the moment is doing well. It will be most interesting to see if her previous spell of many months of pyrexia of unknown origin has at last ended.—I am, etc.,

Whalley, Lincs.

C. E. BROWN.

Nature Cure

SIR,—An "Afternoon Argument" on Nature Cure between the Honorary Secretary of the British Naturopathic Association and a Fellow of the Royal College of Physicians was broadcast in "Woman's Hour" on January 31. I feel

rather alarmed about the affair and would like to suggest a different approach to the problem by our profession.

The F.R.C.P. representing our case did not understand his opponent. He found him living in a different world of ideas, and what he said sounded to him "too complicated, and at the same time too simple." When the naturopath emphasized that he treated the whole person—e.g., not pneumonia, but a person with pneumonia—that disease was a healing process, an effort of the vital force; that to assist this all-important intrinsic factor he used diet, fasting, cold water, and "osteopathy," but no drugs, the F.R.C.P. did not reply, but came straight back to pneumonia, stating that in this disease he treated only the extrinsic cause, the bacteria, stopping their growth with antibiotics.

The result was a draw. The listener was left with the impression that the B.N.A. had as good a case as the B.M.A., if not a better one, since it appeared that the scientifically trained mind was not able to penetrate into the metaphysical depths of naturopathic thought.

This is regrettable, because it is not true. Naturopathy, as a doctrine apart from, and opposed to, orthodox medicine, has no case at all. It has neither a theory nor a practice it can claim its own. Everything these lay healers have got they have borrowed from orthodox medicine 200 years ago. They are old-fashioned, while we are modern. That is the root of the matter. Because they are old-fashioned they appear, to a modern mind, to live in a different world; because they are old-fashioned they appeal to the public imbued with folklore. Medical folklore, too, goes back to ideas and methods taught by the medical schools 200–300 years ago. That accounts for the element of truth in them.

The concept of disease as a natural healing process, and of a vital principle governing the functions of the body, was introduced by the medical schools of the eighteenth century. This vitalistic trend of thought reigned over 100 years in orthodox medicine, long before the B.N.A. was born. Among its representatives were the great masters of our art, the men who laid the foundations of modern medicine. I am referring to the galaxy of Scottish thinkers, Robert Whytt, William Cullen, John Hunter, George Fordyce, Sir Gilbert Blane (*Elements of Medical Logic*, London, 1819), Sir Charles Bell, William Goodsir; the French vitalists, Sabatier, Bordeu, Barthez, Dumas, Bichat; and the German vitalists, Stahl, Gaub, Haller, Blumenbach, Reil, Hufeland, Joh. Mueller, Rud. Virchow. These men, in their lectures and writings, were full of praise for the *vis medicatrix naturae* which preserved the body from putrefaction, and they made wise use of its powers in their practice. They all were convinced "naturopaths," whether they prescribed diet, water, wine, laudanum, mercury, or bleeding. The saying, Feed a cold and starve a fever, goes back to Cullen, the most influential of these orthodox naturopaths.

Nowadays we do not talk openly about the good old *vis medicatrix naturae*, we take it for granted, which seems rather ungrateful. Every day the G.P., the surgeon, the obstetrician has reason to praise a power on which he relies so much. Nor do we talk any more of vital force or vital principle. We are afraid to do so because some of our professors have told us that vitalism is dead. But is it? As a matter of fact, we are quite unable to "explain" or express the true phenomena of life in physical or chemical terms. (Just try "Organization" or "Reorganization" for a start.) It seems that for this purpose the use of vitalistic notions of some sort is still unavoidable, as it was in Hunter's time when he demonstrated, by his famous experiment, the difference between a live egg and a dead egg. Why not admit it? We cannot define "inflammation" or "immunity" without reference to "defence" or "resistance" of the body; we cannot define malignant growth without referring to the "forces which control" normal growth. When a practitioner speaks of stimulation and sedation, does he not omit to add, "Of vital processes"?

In any case my colleagues will agree with me that so far as the cure of diseases is concerned we entirely depend on Nature. The labels "Nature-Cure" and "Naturopathy," therefore, are apt to mislead the public. We do not know of any other cures than cures performed with the help of the natural healing tendency or "power" of the organism. *Natura sanat, medicus curat*—with methods old and new. The question, Drugs or no drugs? does not arise at all. Drugs are always liberated and involved in the natural healing process, because every item of our diet and every part of our body is full of substances which, in their isolated state, are called "drugs."

We know of many different ways to treat a carbuncle—e.g., with diet or fast, with cold compresses or hot poultices, with cream cheese, mag. sulph. paste, or mercury ointment, with intramuscular injections of milk, or blood, or penicillin, with

short waves or x rays. Whatever we do—so long as we refrain from "osteopathic" measures—we are assisting Nature's cure. How exactly our unspecific therapy and our specific therapy promote the natural defence process we do not know (though it would not be too difficult for our experimental pathologists to find out if their bacteriological preoccupation would permit such inquiries). But we know it is always Nature which initiates the inflammatory process we call carbuncle and brings about its resolution, including the destruction of the invading bacteria, in its own inimitable way. We doctors are Nature's humble servants, whatever we think or believe we are doing. The choice of remedies is mainly a matter of taste and fashion.

To sum up this argument in B.B.C. language: The "Naturopaths" have not got anything we have not got (and much improved) in orthodox medicine. Everything they can do, we can do better, safe, and quicker.—I am, etc.,

London, N.8.

F. M. LEHMANN.

Cost of Anaesthetic Techniques

SIR,—Dr. C. P. Brown (March 8, p. 546) takes the flow rates suggested by me (February 16, p. 384) and postulates a patient with a minute volume of 5 l. and an oxygen consumption of 200 ml./min. and shows my oxygen flow to be inadequate. Both these figures might be high for a woman who had received "omnopen and scopolamine" and a total of 0.75–1 g. thiopentone as suggested by Dr. John Bullough in his original article (January 5, p. 28). In cases where Dr. Brown's figures do apply an increase of the oxygen and/or a decrease of nitrous oxide would meet the case. Minimal flow rates are not dangerous if the oxygen is adequate and the carbon-dioxide absorption is efficient. Dr. Bullough mentioned a technique for anaesthesia for a mastectomy involving a total flow of 8 l./min. I merely suggested equivalent figures on absorber technique, which were not intended as a guide to the beginner. I do not wish to draw a red herring across the path by suggesting the best anaesthesia for mastectomies, nor would I deny the very real value of T-piece technique in certain cases.

The only point of my letter was to discourage the development of techniques which involve blowing off large quantities of expensive gases into the atmosphere, and to that I could add the routine administration of costly antidotes to costly drugs. The hospitals have been run by the State for nearly four years now and no attempt has been made by the Ministry of Health to interfere with our clinical judgment in giving drugs. That trust should be respected by exercise of any reasonable economy which will not affect the welfare of our patients. We all pay in the end.—I am, etc.,

Northampton.

F. F. WADDY.

Extensive Resection of the Small Intestine

SIR,—It is gratifying to see two further reports of successful massive resections of the small intestine with good nutritional follow-up results, and I should like to congratulate Mr. H. J. Croot (January 26, p. 195) on reporting them. It is a pity, however, that his review covers only cases reported before 1945, with one exception. There have been increasing numbers of reports of removal of massive amounts of small intestine within the last few years. Professor Linder and I have reported detailed metabolic studies in one case in particular (*S. Afr. J. clin. Sci.*, 1951, 2, 71), with survival for over three years with only 6 in. (15 cm.) of small intestine remaining. Dr. W. Wilkie reported the surgical aspect of the case in 1950 (*S. Afr. med. J.*, 24, 516). Another case of resection of over two-thirds of the small gut has also been reported by us (*S. Afr. J. clin. Sci.*, 1951, 2, 205). These reports contained some of the more important recent references, and the record for small intestinal removal seems to be held by Shonyo and Jackson (*Arch. Surg., Chicago*, 1950, 61, 123), whose patient was left with 4½ in. (11.3 cm.) of jejunum and ileum, but who died a year after operation.—I am, etc.,

Capetown.

W. P. U. JACKSON.

THE CHEMOTHERAPY OF TUBERCULOSIS

Quantity DEMANDS Quality

18 grammes a day for 6 to 9 months is an exceptionally high dosage scheme, yet that is the amount of P.A.S. a tuberculous patient may have to take. Purity of drugs is important in doses as small as 0.01 gramme. How much more vital is it when such a large quantity is taken for so long a period? In the manufacture of 'PARAMISAN SODIUM' purity is the over-riding consideration.

Therefore specify

MORE PROTEIN

To hasten recovery from illness — that is surely one of the most practical applications of Casilan.

And, with Casilan, 'high protein' diets can be prepared just as easily in the home as in the hospital kitchen — an important point to the housewife who must be nurse as well. Ninety per cent protein, flavourless, and extremely light in texture, Casilan blends perfectly into almost any dish the patient fancies or you permit.

Archetype and Schema

SIR,—Many people must have been grateful for both the fairness and the clarity of the leading article on Professor C. G. Jung's work (February 9, p. 314). Especially your remarks on the archetypes were helpful. They should greatly help the non-specialist to appreciate the depth and the empirical nature of Jung's work. As you stress, he is not systematic—i.e., not committed to dogma. Jung again and again stresses these points that should be obvious to anyone reading his works without bias.

In one of his latest books (*Aion*, Rascher, Zurich, 1951, p. 9) he says: "May the reader never forget that I make no confessions of creed or compose tendentious works, but consider how certain matters can be understood from the point of view of modern consciousness" (my translation). Jung is not a metaphysician, he is a physician predominantly interested in the psyche. He says elsewhere that the archetypes may have a cerebral basis. There are signs that we may learn more about that in the future. Sir W. Russell Brain has pointed out recently ("The Concept of the Schema in Neurology and Psychiatry," in *Perspectives in Neuropsychiatry*, H. K. Lewis, London, 1950, p. 139) that the "schema . . . is describable at the same time in both neurological and psychological terms. . . . The schema is a neurophysiological disposition which may or may not enter consciousness and which plays an essential part in perception and action; speech and thought. It is both physical and mental and . . . may prove to be the bridge between body and mind." I think Jung would have little objection if archetypes were regarded as the psychological side of such a neurophysiological disposition. Brain's and Jung's standpoints differ perhaps only by their emphasis.—I am, etc.,

Sedgefield.

D. J. SALFIELD.

Epigastric Hernia and Dyspepsia

SIR,—I agree with Dr. Roy Houghton (January 26, p. 220) that epigastric hernia is a cause of dyspepsia far more common than one would suppose from the casual and inadequate description given in most textbooks, but I doubt whether his explanation of the apparent connexion between this condition and emphysema is the true one.

Some years ago in an ordinary industrial practice I collected notes of 12 cases of epigastric hernia I saw in as many months, and since then, always on the lookout for them, have seen probably four or five a year. Of the 12 the youngest was a boy of 4, the oldest a woman of 80, with males predominating in the intervening ages. The herniae varied in size from as large as half a walnut to as small as an orange pip, most being small.

I believe that in most cases the prime cause is a tiny congenital defect in the interlacing fibres of the linea alba, perhaps at a point where a blood vessel traverses the layer. This defect, yielding before intra-abdominal pressure, enlarges until a sac of peritoneum herniates through; thereafter the opening gradually becomes circular and its edges fibrose, thus limiting further enlargement, the sac meanwhile having become occupied by a small tag of omentum or, more rarely, a small knuckle of intestine. In some patients the hernia will appear spontaneously, in others only when assisted by acute or chronic muscle strains—e.g., coughing.

Not all herniae produce trouble—I have a boy of 7 under my care who has two with no symptoms. When they do occur, symptoms follow a fairly constant pattern and are easily mistaken for those of gastric ulcer—I have seen two patients so misdiagnosed by well-known consultants. The patient complains of sharp epigastric pain during or immediately after a meal, fullness, nausea, and sometimes vomiting, which relieves the pain.

On examination, unless these lesions are specially looked for, they may be missed, particularly in fat patients. Some herniae are very small, may be invisible with the patient lying down (probably seen, however, with the patient standing and coughing), and are not always felt by flat-hand palpation. If the pulp of the middle finger is drawn with gentle pressure along the line between xiphisternum and navel the unseen hernia will be encountered as a hard pea-like nodule, almost certainly tender, which will usually dis-

appear on firm pressure with a characteristic palpable gurgle, leaving the finger holed and resting on the ring-like edges of the hernial opening. The patient in pain is immediately and dramatically relieved by this reduction. If the sac is not protruding at the time of examination the finger method will usually detect the hole—and a cough impulse may then be elicited.

Radical cure is by operation. The fibrotic rim of the opening in the aponeurosis is elliptically excised, the sac is transfixed, and if large enough excised, the edges of the ellipse sutured with good overlap. A belt with a pad to fit over the hernia will usually give satisfactory relief to those unfit for or refusing operation.—I am, etc.,

Horsham.

F. TAYLOR.

Hazards of Manipulation

SIR,—Mr. Robert Hafner is to be congratulated on his clear and precise account of the dangers of manipulation of protruded lumbo-sacral intervertebral disks (February 16, p. 361). In a recent series of 150 cases of disk syndrome I had three who had an exacerbation of pain following manipulation under anaesthetic. In each case the pain was of great severity and lasted 24–72 hours before gradual amelioration occurred with absolute rest.

What Mr. Hafner does not make clear, and it is an important omission, is that he refers to the usual indiscriminate manipulation under an anaesthetic. His patient was partially anaesthetized, and his accurate description of the onset of pain shows that it was spinal flexion which did the eventual damage. This movement is never used in the recognized technique of lumbar manipulation without anaesthetic (Cyriax, J., *Textbook of Orthopaedic Medicine*, vol. 2, 1950), and as a consequence the complication of severe exacerbation is unknown with this form of treatment. It is therefore most important to distinguish between the two methods.—I am, etc.,

London, S.W.3.

JOHN EBBETTS.

Referred Backache

SIR,—It was a great pleasure to me to read Professor Hugh C. McLaren's paper (February 16, p. 347), in particular to see it authoritatively stated that post-natal cervical erosion does not cause backache. For decades women with backache, largely because they complain that the lumbar pain is more severe at period times, have been thought to harbour a pelvic cause for their symptom. In fact, during menstruation, pain referred to the back from the uterus is superimposed on the backache arising from the back. These two pains, felt in the same place, summate. One has only to remember how often men suffer from backache to realize that backache in women, no less than in men, usually originates from the moving parts of the back.

I should like to commend a simple preliminary test to be performed whenever the question arises of the provenance of a woman's backache. She stands, and bends her trunk forwards, backwards, sideways each way, and twists each way as far as she can. If one or more of these movements hurt at the extreme or there is a painful arc, a lesion exists of the moving parts of the back. If no movement hurts, pain referred to the back from elsewhere is present.—I am, etc.,

London, W.1.

JAMES CYRIAX.

Carcinoma of Adrenal Cortex

SIR,—The article by Drs. R. J. Harrison and Denis Abelson (February 9, p. 303) has prompted my memory of a case seen at Western District Hospital, Glasgow, while resident physician.

An elderly man, of very dark complexion, cachectic to some degree, with slight buccal pigmentation, normal blood pressure of about 140/90, and marked asthenia, did not give a good history, but was suspected of having a high gastric carcinoma.

He died following haematemesis, and at necropsy was found to have what appeared to be a carcinoma of the lower oeso-

phagus, the source of haemorrhage. He also had bilateral enlargement and caseation of the adrenal glands. Histology, however, suggested carcinoma of the suprarenal cortex, with lymphatic spread to the oesophagus. The patient also had bilateral silicosis and caseating tuberculosis.

Except for the normal blood pressure the patient had an Addisonian-like appearance, and this is of interest, considering the involvement of the adrenal cortex.—I am, etc.,

Glasgow.

GILMOUR HARRIS.

Educating the Public about Cancer

SIR,—I have read with great interest Dr. N. E. McKinnon's pessimistic letter (March 8, p. 544) and his article in *Surgery, Gynecology and Obstetrics*, February, 1952 (p. 173).

Nearly everybody realizes that prognosis in cancer depends very largely on the degree of differentiation and power of the tumour to metastasize. I say nearly everybody, because some people still seem surprised to find that patients with a well-differentiated tumour can be "cured" in spite of delay in diagnosis and seem to forget that those which are undifferentiated may become inoperable in the same space of time. Dr. McKinnon, however, seems to assume that tumours can be classified into:

(a) those that are so undifferentiated and metastasize so soon that early diagnosis is impossible, or

(b) those that are so well differentiated that early diagnosis is unnecessary.

The evidence for such an assumption which he gives in his article quoted is not convincing. Surely experience, and indeed some experiments with corneal transplants, suggest that there are all degrees of differentiation, and even that some tumours may become less differentiated in the course of time. It is in such cases as these that early diagnosis will help.

In the case of cancer of the cervix uteri, Heyman's *Report* (Vol. VI), which includes records of 41,046 patients, shows that, between the publication of Volume IV in 1941 and Volume VI in 1949, the percentage of stage I and II cases has increased with a corresponding increase in the percentage of the five-year survival rate without symptoms or signs. This increase for all cases treated is shown to be 5.1%, and of this improvement Heyman suggests that 3.2% is due to the "quality of the material" and 1.7% due to improved treatment.

Dr. McKinnon in his article (*Surg. Gynec. Obstet.*) states that there has been no material reduction in cancer mortality during the last 20 to 30 years due to earlier or different treatment. If this is so, Nature is being kind and providing more differentiated tumours.

It is true that there is not nearly enough evidence to correlate time of diagnosis, stage of the disease, and the type of the tumour, and it is hoped that a critical experiment under the guidance of statisticians at every stage of the experiment will be undertaken in this country as soon as possible.—I am, etc.,

London, W.14.

M. DONALDSON.

SIR,—Recent letters in the *British Medical Journal* have shown a pessimistic attitude towards the early treatment of breast cancer. It is advisable that the arguments adduced should be refuted.

The belief of the medical profession is that a certain number of cases of breast cancer, if seen early and radically treated, are cured; some are not cured but remain free from signs of "recurrence" for long periods, even up to nine or ten years of useful life. Unfortunately, others are very soon in a hopeless condition.

Dr. N. E. McKinnon (March 8, p. 544) bases his attack on these beliefs entirely on statistical evidence that the mortality rates from breast cancer remain unchanged, in spite of propaganda and early treatment. But he is dealing with two variables: one, the incidence of breast cancer in the female population; the other, the number of cases that get early and adequate treatment. If (as seems likely in an

ageing population) the incidence of breast cancer is increasing, and concurrently the proportion of those who get early treatment by modern surgery and radiation with good results has also increased, then the mortality rates would not show much change.

The rather rare atrophic breast cancer can remain free from metastases, but is usually fatal in the end. However, Dr. McKinnon summarily dismisses all the (admittedly) large number of breast cancers that do well after treatment as belonging to a non-lethal and non-metastatic variety of cancer. Surely such an assertion would require evidence from the pathologists. If there is no evidence at all, we can continue in the more sensible and comforting belief that the fortunate women who do well have done so as the result of good treatment.—I am, etc.,

Hastings.

HARRY GABB.

SIR,—Dr. N. E. McKinnon's letter to you on this subject (March 8, p. 544) does not appear to be helpful in the campaign against cancer. Whatever may be the statistical facts about breast cancer, the same does not apply to cancer in other parts of the body, especially the larynx and deep pharynx. It has been my painful experience over the last six years to see at least 10 cases of carcinoma in the cricoid region too far advanced for successful treatment. The causes are many, among which are fear on the part of the public of this disease, and their ignorance of the result of treatment. May I add that I disagree with the quoted words of Dr. James F. Brailsford: on the contrary, we have something solid to offer, and it should not be done quietly.—I am, etc.,

Liverpool.

JOHN MCFARLAND.

Sexual Disorders in Women

SIR,—I do not agree with Dr. Joan Malleson (February 23, p. 437) that some women have their erotic sensation limited to the cervix. Deep penetration by touch and pressure will undoubtedly give rise to sensation in the pelvis interpreted by some women as an added emotional factor to the joy of sexual intercourse and by other women as dyspareunia. Even if erotic sensation were present in the cervix, it is doubtful whether the thin rubber of the occlusive cap could prevent stimulation of the cervix by the thrusting penis. It is true, however, that discarding the cap does occasionally lead to complete orgasm, but many years of experience of sexual disorders and contraception have convinced me that the basis of this is emotional. The lowest part of the anterior vaginal wall is of course erotic, because stimulation here is directly on the tissues of the vestibule and round the urethral orifice. The penetrating penis produces erotic sensations by friction at the upper two-thirds of the vaginal introitus, having practically direct contact with the tissues under discussion. A well-fitting cap cannot interfere with this contact except, as always, for psychogenic reasons, and once again discarding the cap does in a small percentage of women help to relieve varying types of emotional tension and may allow orgasm.—I am, etc.,

London, W.1.

PHILIP M. BLOOM.

Male Infertility

SIR,—Your leading article (December 22, 1951, p. 1507) drew attention to work by Nelson and others, who have shown that big daily doses of testosterone given to men with defective spermatogenesis cause further inhibition of spermatogenesis. But if the testes are examined a year or two after treatment there is a regeneration of the seminiferous tubules and a normal sperm picture, in contrast to the defective spermatogenesis present before injection.

This result was interpreted as meaning that the testosterone originally suppressed the pituitary gonadotrophic hormone; but that a subsequent rebound effect occurred, stimulating the production of gonadotrophic hormone.

In 1938 I published a paper (*Lancet*, 1938, 2, 1457) describing a comparable phenomenon. I showed that injection of large

doses of oestrogen in human beings produced a decrease in urinary output, followed by a polyuria on stopping injections. This polyuria was more than could be accounted for by a mere release of retained fluid and was interpreted as being due to a depression followed by stimulation of the anterior lobe of the pituitary gland.

In 1939 Bishop and I reported (*Guy's Hospital Reports*, 1939, 89, 240) a case of Cushing's syndrome in which the patient found it necessary to shave every fourth day. On 10 mg. oestradiol benzoate daily by injection she required to shave only every eighth day, but on cessation of injections she had to shave every other day. This retardation and subsequent acceleration of hair growth were observed more than once in the patient. This phenomenon was interpreted as being due to depression followed by stimulation of the anterior pituitary, adrenocorticotrophic hormone.

A study of the literature revealed that Clauberg and Breiphof (*Klin. Wschr.*, 1935, 14, 119) had described a similar pituitary release effect in connexion with gonadotrophic hormone production in rats. Evidence is thus accumulating of a method of stimulating the production of pituitary trophic hormones. Apart from this technique I know of no other method of stimulating the pituitary to increased production of its hormones.

For some years I have used this principle in the treatment of impotence in the menopausal male. Instead of giving small doses of testosterone such as 10 mg. three times a week, I have used 25 mg. daily for ten days and then stopped. I have done this on the assumption that while used as replacement therapy this dosage inhibits the production of gonadotrophic hormone, but that on cessation of injection gonadotrophic hormone production is stimulated. My cases have been too few, and the results so complicated by the possible purely psychological benefits, that it would be unscientific to draw any conclusions. Perhaps some clinic with more facilities and a large number of cases might compare this method with a control series injected with some placebo.

Finally, it seems quite probable that a similar stimulation of A.C.T.H. production should be obtainable by giving a sufficiently large dose of cortisone for a sufficiently long time first to depress but subsequently to stimulate A.C.T.H. production.—I am, etc.,

Capetown, South Africa.

B. G. SHAPIRO.

The Place for Voluntary Work

SIR,—In your leading article (February 16, p. 367) you make or repeat statements which seem to be of doubtful accuracy in regard to fact or philosophy (unless of course one accepts that of Karl Marx). Thus you say:

(1) "It is often forgotten that the Health Service has grown from voluntary work and the efforts of charity."

(2) You repeat without comment that "to many social reformers charity has a suspicious and unpleasant sound," and you speak of "replacing the inadequate haphazard . . . patronage of the poor . . . by granting the right to all citizens equally to obtain aid from an impersonal State."

(3) "Man is a social animal, which means . . . he has the instinct to work with and to aid his fellows."

Will you allow me to comment in reverse order on these statements, though they are all connected by the same thought—namely, that the root cause of the malaise of N.H.S. must be sought for in its basic philosophy, otherwise any proposed remedies will be only symptomatic treatment.

In regard to (3) it is a fact of history that the Church in England (*Ecclesia quod est in Anglia*, of Magna Carta) founded our first hospitals and shaped our civilization, and I suggest it is nearer the truth to say that the urge to voluntary service derives from the still deeply rooted influence of its teaching—i.e., that it originates not from the *Jungle Book* or *Das Kapital*, but from applied Christian philosophy, as taught for centuries by the Church. This philosophy included a belief that man (and it still holds good for *Homo sapiens*) is partly physical, partly metaphysical in his being, and that in consequence he is subject to both physical and spiritual laws. He cannot invent these laws, he can only discover them. If he breaks any of either category, he becomes ill, physically, mentally, or morally—e.g., the present feeling of frustration.

(2) My comment on this is that the organizers of every revolution play upon real or imaginary grievances; and I hope you will make it clear that you do not concur in these opinions so far as the now dead voluntary hospitals are concerned. It is pure

Communist propaganda—cf. Marx: "To each according to his need; from each according to his ability."

(1) To describe the replacement of the voluntary service by the National Health Service as a process of natural growth is just nonsense, except in the sense that a neoplasm grows out of the body.

The voluntary system, I believe, grew out of the Christian philosophy and tradition. The National Health Service constituted, according to the politicians, an essential part of a social revolution. A revolution is a complete break with tradition and the founding of new institutions based upon a totally different philosophy, in this case the replacement of a system based on Christian philosophy by one based upon that of Karl Marx. The former produced self-reliance and taught free men to give voluntary service. The social effect of the latter is illustrated in the current phrase, "What can I get out of the State?" I think myself that it is optimistic to hope that this moral rot can be cured except by a radical change of philosophy.—I am, etc.,

Bournemouth.

DAVID HARDIE.

Pseudocyesis

SIR,—With reference to your interesting annotation on pseudocyesis (March 8, p. 538) an experience I had with a Scottie bitch some years ago may be of interest.

This animal came into season normally, and was mated to a good stud dog. She developed the usual signs of pregnancy, although we were never quite sure of the puppy movements, and began to whelp on the appropriate day.

We were expecting a difficult delivery, so I sat with her for the whole four hours of her labour, during which she pushed and heaved amazingly, with the production of nothing but a little mucus.

At the end of this time her activities died away leaving us both tired and fed-up and the bitch her former slim self. I went to a neighbouring kennel where I had a spaniel bitch with an over-large litter, and brought the Scottie two day-old pups, which she brought up beautifully.

Now there was no evidence that the Scottie had a mental conflict soluble by pregnancy. I have always thought that the whole process was set in motion by her mating. Is this evidence that there may be a similar physiological process occurring in women as a result of intercourse? How frequently does pseudocyesis occur in celibate women?—I am, etc.,

London, S.E.27.

EDITH M. W. ELLIOTT.

Attempted Suicide

SIR,—Dr. P. Jacobs's letter on this subject (March 1, p. 490) has only just come to my notice. In case junior hospital residents, and others, may be misled by Dr. Jacobs's advice that they should act as police informers in cases of attempted suicide or suspected foul play under their care I must contradict his opinion.

A doctor's duty begins and ends with the treatment of the medical condition from which his patient is suffering, and, provided he carries out this treatment to the best of his ability and in the interests of the patient, he has fulfilled his responsibility. Whatever some coroners may say, informing the police of an attempted suicide or of a case of suspected crime is not part of the treatment of the patient nor is it in the medical interest of that patient. Clearly, if it became known that medical practitioners acted as police informers or in other ways disclosed medical secrets it would at once prove an effective bar to seeking medical aid to some in great need of it. Professional secrecy must be maintained. It is basically inherent in the confidence with which the public approaches the medical profession. Any temptation to depart from this rule for purposes of expediency in a particular case (such as calling the police to watch at the bedside), or because of a fear of being blamed by some authority, must be resisted as being beyond medical duty and contrary to the public interest.—I am, etc.,

JOHN THWAITES,
Chairman, Central Ethical Committee.

Obituary

G. W. M. FINDLAY, C.B.E., M.D., D.Sc., F.R.C.P.

We announce with great regret the sudden death of Dr. G. W. M. Findlay on March 14. He had been editor of *Abstracts of World Medicine* and *Abstracts of World Surgery, Obstetrics and Gynaecology* since 1946 and was well known for his research work on yellow fever and other virus diseases.

George William Marshall Findlay was born on January 6, 1893, the son of Dr. George Findlay, of Brailes, Warwickshire. From Dean Close School he

[Bassano, Ltd.]

went to Edinburgh University, where he was in his final year as a medical student when the first world war broke out. He volunteered immediately as a medical aide in the Belgian Army. After graduating M.B., Ch.B. with first-class honours in 1915 he became a surgeon lieutenant R.N. and served with great distinction for the rest of the war, being created O.B.E. and awarded the *Médaille du Roi Albert* by the Belgian Government.

At the end of the war he returned to Edinburgh as assistant pathologist at the Royal Infirmary and as lecturer in pathology at the university, where he proceeded M.D. (gold medal) in 1920 and D.Sc. in 1922. Findlay was a man of wide outlook, throwing himself with great energy into any project which interested him, and it was soon apparent that he possessed outstanding qualities as a research worker. In 1923 he joined the staff of the Imperial Cancer Research Fund, where he remained until he took up an appointment at the Wellcome Research Institution in 1929. At one time or another he held a Lister Research Fellowship, a Carnegie Research Fellowship, a Freeland Barbour Fellowship, and an Alice Memorial Fellowship. During the course of his researches he travelled all over the world, working for a time at the Pasteur Institutes in Paris and Tunis and in the Rockefeller Institute in New York. With problems of disease in Africa he was specially familiar. He was a member of the Foot and Mouth Diseases Research Committee.

The list of Findlay's publications (82 papers written by himself or in collaboration with others were published between 1930 and 1940 alone) shows how extraordinarily diverse were his interests, but in the nineteen-thirties his most important work was on yellow fever, particularly on the development of methods of immunization against this disease, which he was able to study in the Gambia. For this work he was created C.B.E. in 1935. Another of the diseases which he studied at this time was Rift Valley fever, on which he published several important papers. The subject of chemotherapy attracted him from his early days as a student, and the first edition of his book *Recent Advances in Chemotherapy* was published in 1930. The second edition appeared in 1939, and the first two volumes of the third edition have recently been published.

During the second world war Findlay was able to put his extensive knowledge of tropical diseases to most practical use. In 1940 he was sent first to Tunis to investigate trench fever and later to the Sudan and Abyssinia to continue his work on yellow fever. From 1942 to 1946 he was consulting physician to the West African Forces with the rank of brigadier. His important studies on the prophylaxis and treatment of malaria and blackwater fever won him further credit, and he also published papers on infective hepatitis. During the last two years he had been investigating the Cocksackie virus, publishing a paper on this in the *Journal* in 1950. Findlay became a member of the Royal College of Physicians in 1942 and was elected a Fellow in 1948. For some years he was honorary editor of the *Journal of the Royal Microscopical Society*—a society which paid him the honour of electing him its president in 1950. Besides being a prolific writer himself, he was interested in the problems of disseminating scientific information, and at the time of his death was chairman of the Abstracting Services Consultative Committee set up by the Royal Society.

Findlay took on the job of editor of the abstracting journals published by the B.M.A. for the first time in 1947. A man of remarkable versatility, he decided after some hesitation to leave the Wellcome Institution and come over to B.M.A. House. With his colleagues on the staff of the *B.M.J.* he worked out plans during the second half of 1946 for *Abstracts of World Medicine* and *Abstracts of World Surgery*, the mainstays of his team then being Dr. S. S. B. Gilder and Miss Marjorie Hollowell. The idea behind the abstracting journals was that they should provide the general reader with a current survey of what was best in the world's medical periodicals: the journals were selective in their choice of articles to be abstracted, and the abstracts long enough to be informative rather than merely indicative. Findlay wrote many abstracts himself, but his heart was really in the laboratory, this being reflected to some extent in the choice of articles to be abstracted. A quick and indefatigable worker, with an encyclopaedic mind, he did not really take kindly to all the detailed work involved in producing two monthly journals: his interests were too varied for this. In the lunch intervals he would spend his time in the laboratory, and, as an afterthought almost, he was engaged in writing his monumental *Recent Advances in Chemotherapy*. And at the end of the day he would be seen going home with a bundle of books from the London Library under his arm. His pen and his advice were always at the disposal of the *B.M.J.*, to which he had been an anonymous contributor before the war. In spite of this enormous pressure of work he was always urbane and unruffled, and had a certain boyish glee in recounting stories of the less dignified aspects of the private lives of eminent bacteriologists. He will be sadly missed by his colleagues in the Journal Department of the B.M.A., and their deep sympathy is extended to his widow and two daughters.

Dr. O. C. Carter, Chairman of the Journal Committee of the British Medical Association, writes: In the sudden death of G. M. Findlay the profession has lost a man of outstanding academic attainment, and the Association will mourn the passing of one of its very distinguished officials. When the B.M.A. was contemplating the publication of *Abstracts of World Medicine* it was not easy to find someone who, under the general direction of the editor of the *B.M.J.*, would be fitted both academically and from the literary point of view to be the editor of *Abstracts*. from the infant to the aged and infirm, Cascara Evacuant is an eminently suitable and palatable tonic laxative. It assists normal function by mild peristaltic stimulation, without 'cathartic habit' formation.

The dosage ranges from one or two drops in the milk, for infantile constipation, to 30 drops in older patients. For most cases 10 to 15 minims is sufficient.

Packages: Supplied in 1½, 4 & 16 fl. oz. bottles

much thought and searching the Journal Committee, while in session, actually sent out one of its members to find Dr. Findlay and invite him to come to that committee. The search proved successful and Dr. Findlay came to see us, and, much to our great satisfaction, he agreed to undertake a very difficult task. Dr. Findlay not only succeeded in the work which he had set out to do, but by his charm of character and fund of knowledge he quickly gathered around him a large circle of friends who now will miss him sadly. The Association has lost a distinguished servant and will wish to extend to his widow the deepest sympathy in her great bereavement.

F. O. M. writes: With the passing of Marshall Findlay goes perhaps one of the most interesting figures in the field of virus research in Great Britain during the past 25 years. His interests and output of work ranged widely over biological and chemical investigations. Perhaps his greatest strength lay in the application of his facile pen and photographic mind to the collection and condensation of large subjects into accurate and readable accounts. The best examples of this were his *Recent Advances in Chemotherapy* and his chapters on "Variation in Viruses and Inclusion Bodies and their Relationship to Viruses" in Doerr and Hallauer's *Handbuch der Virusforschung*; and, of course, this talent was given great scope when he took on the editorship of *Abstracts of World Medicine*. But the call of the laboratory was still great, and he soon found a niche in the laboratories of the near-by Pharmaceutical Society, whence in his spare time he continued to send out papers recording the results of his investigations.

His work can be divided into several fairly distinct phases. His first researches, carried out in the laboratories of the College of Physicians at Edinburgh, were in the field of pathological and biochemical changes in experimental vitamin-deficiency, particularly avian beriberi and scurvy in guinea-pigs and rabbits. His own observations and those of many other workers at this time showed that animals were more susceptible to infection when on vitamin-deficient diets. As a result of his work on vitamins C and B he suggested that the lowered resistance might be due in part to degenerative changes and feeble leucoblastic reaction seen in the bone marrow and the lowered bactericidal power of leucocytic exudates.

At this stage he moved to the laboratories of the Imperial Cancer Research Fund in London, where, after a few brief experiments on the effect of tar and ultra-violet light on skin cancer, he embarked on the field of virus research which was his main interest from 1925 to his death. In collaboration with Ludford he published a pictographic review of the cell inclusions associated with certain ultra-microscopic diseases, and followed this with studies on the cytology of fowl pox. Later he found that fowl-pox virus grew in the same type of chick-embryo culture as Carrel and Rivers had used for vaccinia. This led him on to immunological and serological studies which confirmed the work of Levaditi and others that these two viruses were unrelated. He next entered the field of the virus aetiology of cancer and worked with several strains of infectious myxomatosis of rabbits. In 1929 he noted minute granules in the connective tissue cells of the lesions, around which controversy was centred at that time, but he came to no further satisfactory conclusion on whether or not they were the virus.

In 1929 Findlay joined the staff of the Wellcome Bureau of Scientific Research, where interest was focused on virus in relation to tropical disease rather than cancer. He joined with Hindle in the attack on yellow fever, work on which had recently entered a new phase as the result of the transmission of the disease to monkeys by Stokes and his colleagues in West Africa and Theiler's adaptation of the virus to mouse brain. They concentrated at first on trying to obtain a suitable vaccine, using killed virus from monkeys, and then, like the American workers, attempted immunization with living virus and immune serum. After a visit to the United States Findlay began work on the

growth of yellow-fever virus in tissue culture; this provided a more suitable virus for immunization. Finally the 17D strain of virus was introduced from the Rockefeller Laboratories, and over the course of the next few years some thousands of Colonial Service employees were safely immunized against yellow fever.

These tissue-culture vaccines also contained "normal" human serum, and early in 1936 it became apparent that cases of jaundice were occurring in the recipients which were not due to yellow fever. These observations came to light at the same time as a report of jaundice in children receiving convalescent measles serum, but all attempts to isolate or determine the agent involved were unsuccessful; and, in fact, the incidents appeared to attract little outside attention. However, when this phenomenon appeared on a large scale in those receiving yellow-fever vaccine, multiple injections, and transfusions in the period 1939 to 1945, the work of Findlay and his colleagues formed a basis for further investigation. Findlay himself spent most of the war in West Africa, where he was consultant to the W.A.F.F., and found many opportunities to apply his energy and knowledge to problems of tropical medicine. When naturally occurring jaundice and that associated with yellow-fever vaccine appeared in the troops he seized the opportunity to renew investigations of this problem once more. In experiments on human volunteers he made the same observation as MacCallum and Bradley in England and Havens and his colleagues in the U.S.A., that stools from patients with infective hepatitis produced the disease when given by mouth to susceptible humans. In addition some of his volunteers were infected with urine, but he suggested that this was due to contamination by blood as a result of bilharzial infection. In his studies of the natural disease among the indigenous population he made the important observation that there was a much higher mortality among those on deficient diets. Thus he had returned to his original theme, and, in fact, some of his latest experiments were on the effect of Rift Valley fever virus on rats receiving a deficient diet.

Like most workers in the virus field, he collaborated with various colleagues in many unsuccessful searches for viricidal substances. Particularly was this so in relation to lymphogranuloma venereum. He also investigated the treatment of various tropical diseases—yaws, for instance—while in West Africa, and was quick to apply the newest antibiotics, such as chloramphenicol. In addition to all this he was the first to identify the virus of lymphocytic choriomeningitis in Great Britain, and with MacCallum recorded the first example of the interference phenomenon between two antigenically unrelated viruses.

It falls to the lot of few men to make truly original contributions in their scientific field, and Findlay's efforts were really never adequately rewarded in this respect. However, he added much to our knowledge of infectious diseases and stimulated many a worker both at home and abroad to intensify his efforts.

Professor G. A. H. Buttle writes: Dr. Findlay was one of the most energetic and hard-working men engaged in medical research. His knowledge of the literature was encyclopaedic and his enthusiasm for new investigation quite unflagging. Fifteen years ago he was the first to show the action of the sulphonamides in infections due to the large viruses, and he had always been anxious to extend the field of chemotherapy to the much more difficult problem of the small viruses. For the last few years of his life he spent much of his time investigating poliomyelitis and other viruses in mice. He worked along many different lines which suggested themselves on account of various physiological and pathological considerations; he was able to show a considerable antagonism between certain viruses while others potentiated one another. He also showed that there is a great decrease in the susceptibility of rats and mice to many viruses at the time the animals are weaned. At the time of his death he was engaged in an investigation of the influence of the hormones of the anterior pituitary and of the supra-renal cortex on the progress of virus infection.

Findlay was a most helpful and energetic colleague. He seemed to get an immense amount of work done in a very short time, and his life was so well organized that no time appeared to be wasted. The book which he was writing, *Recent Advances in Chemotherapy*, is quite the most comprehensive available account of the development of chemotherapy. The single volume he wrote in 1930 has grown into four volumes, two of which—the first on the chemotherapy of disease due to worms and to protozoa and the second on the chemotherapy of malaria—have already been published. He leaves us at the very height of his powers, and it is to be hoped that his work on the small viruses may be continued and extended until some means are found of controlling these infections.

Sir JOSEPH SKEVINGTON, K.C.V.O., F.R.C.S.

With the passing of Sir Joseph Skevington on February 29 at the age of 79 the Royal Borough of Windsor and the surrounding area lose a much beloved and respected resident and the medical world a distinguished surgeon. It was due chiefly to him that King Edward VII Hospital, Windsor, attained such high standing. He had remarkable foresight and driving force, and possessed the power to attract the sympathy of wealthy friends and patients towards the hospital, the main interest of his life; the plaques over wards and departments bear evidence of their generosity.

Born at Rothley in Leicestershire on February 2, 1873, Joseph Oliver Skevington was the son of J. H. Skevington, J.P., a farmer, and was educated at Oakham School and at St. Mary's Hospital, London, qualifying M.R.C.S., L.R.C.P. in 1898. He was house-surgeon to the late Mr. H. W. Page, upon whom he was to operate many years later. He obtained the F.R.C.S. in 1899 and a little later served in the Boer War as a civil surgeon to the South African Field Force. It is interesting to record that he took some of the first x-ray photographs ever to be taken in war.

Skevington settled in general practice in Windsor in 1903 and was elected to the staff of what was then the Windsor Royal Infirmary. His surgical practice developed rapidly and in six or seven years he was so overworked that he gave up general practice and confined himself to the work of a consulting surgeon, which included appointments at some nine hospitals of various sizes, among them being Maidenhead, Staines, Iver, Egham, Ascot, Windlesham, and Bagshot Cottage Hospitals.

In August, 1914, he went to Rouen as senior surgeon to No. 2 British Red Cross Hospital, but was invalided home in 1915. He returned to his work in Windsor and became surgeon to war hospitals in the vicinity and to the Brigade of Guards, Pirbright Camp, and Victoria Barracks, Windsor. In 1918 he returned to active service as a captain in the R.A.M.C. In 1919 he was created K.C.V.O.

Sir Joseph Skevington was a fine, hard-working, and conscientious surgeon who was much loved by his patients. He retired in 1936 after 33 years' service as honorary surgeon to King Edward VII Hospital, during which time he was also in charge of the x-ray department, an appointment he continued to hold until 1942. He was president of the Windsor and District Medical Society in 1929-30. During the last war he served his country a third time as a major in the Home Guard, and he was also chairman of the Berkshire Local Medical War Committee. He played golf and was captain of Sunningdale in 1931. Being extremely interested in flowers and gardens, he derived great pleasure from

visits to Chelsea, Kew, and Wisley. Sir Joseph Skevington, who did not marry, was the only surviving member of his family, but there are many friends and patients who mourn him.—J. G. J.

C. KILLICK MILLARD, M.D., D.Sc.

Dr. C. Killick Millard, who was medical officer of health for Leicester from 1901 to 1935, died on March 7 at his home in Leicester, aged 81 years. Besides being a distinguished member of the public health service Dr. Millard was well known for his work for the Voluntary Euthanasia Legalization Society and for his views on vaccination against smallpox.

Charles Killick Millard was born on August 14, 1870, one of a family of nine. His father was the Rev. C. S. Millard, Rector of Costock, Notts. Educated at Trent College and Edinburgh University, Killick Millard graduated M.B., C.M. in 1892, proceeding M.D. in 1896 and D.Sc. (public health) in 1898. His first appointment was as resident medical officer at the Birmingham Fever Hospital during the severe epidemic of smallpox in 1893 to 1894, and he chose the subject of smallpox for his M.D. thesis. In 1896 he was promoted to be medical superintendent of the hospital, and held the position until 1899, when he became medical officer of health for Burton-on-Trent. Two years later he was appointed medical officer of health for Leicester.

Millard was not afraid of championing unpopular causes which he believed to be sound. Thus, while he was at the Birmingham Fever Hospital he carried out a statistical inquiry into the value of hospital isolation in reducing the prevalence and mortality of scarlet fever. He read a paper before the Society of Medical Officers of Health embodying the results of his inquiry, which, he contended, demonstrated the uselessness of this measure. His conclusions were strongly criticized at the time, but since then they have come to be fairly generally accepted. It was on the question of vaccination and smallpox that Killick Millard made his most distinctive stand. The town of Leicester had openly abandoned infant vaccination some 15 years before he went there as medical officer of health. Soon after his arrival smallpox was introduced into the town on several occasions, but the outbreaks were controlled without difficulty. It was because of this experience that Killick Millard felt compelled to modify his previously orthodox views about vaccination. He expounded his theory in a course of lectures given under the auspices of the Chadwick Trust, and these he afterwards published in book form in 1914 under the title *The Vaccination Question in the Light of Modern Experience*. His views about the effect of vaccination in protecting the infant did not differ from the orthodox view, and he gave a practical demonstration of his faith in the power of vaccination by taking his wife and two young children—all recently vaccinated—into the smallpox hospital and photographing them by the bedside of a patient with severe confluent disease. He was, however, against compulsory infant vaccination, and against mass vaccination as a means to control outbreaks of the disease. In his opinion the vaccination of all contacts was sufficient. He was of course prominent among those who welcomed the abandonment of compulsory vaccination when the National Health Service Act came into force in 1948.

In his later years he became interested in the question of voluntary euthanasia and may be said to have been the pioneer of the modern movement known by that

name. He was the honorary secretary of the Voluntary Euthanasia Legalization Society when it was founded in 1935. Lord Moynihan was its first president, and the society had the backing of a number of distinguished men in the Church and in the medical profession. The society promoted a Bill which was introduced by Lord Ponsonby in the House of Lords in 1936: this secured a good discussion, although it failed to attain a second reading. The subject was again discussed in the House of Lords about fifteen months ago.

Killick Millard was a man of the highest principles and received many professional honours during the course of his life. Besides being chairman of the Leicester and Rutland Division of the B.M.A. from 1923 to 1924 he represented his Division at a number of Annual Meetings, and was vice-president of the Public Health Section in 1909 and again in 1932. In the latter year he was also president of the Society of Medical Officers of Health, choosing the subject of voluntary euthanasia for his presidential address. In Leicester he was president of many local societies, including the Leicester Medical Society, the Leicester Literary and Philosophical Society, the Leicester Rotary Club, the Leicester Temperance Society, and the Leicester branch of the Band of Hope Union. At the age of 62, when others are considering limiting their activities, Killick Millard took up flying and obtained his pilot's certificate. On his 80th birthday he bought himself a motor-cycle and shortly afterwards toured Scotland on it. During the second world war he emerged from professional retirement to become temporary medical officer of health for the Blaby and Lutterworth Rural District, a post which he relinquished only a year ago. Dr. Millard married Miss A. S. Longley, daughter of the Vicar of Saltley, in 1899. His wife died in 1950. He is survived by two sons, the elder of whom is in general practice in Leicester, and two married daughters.

Mr. N. I. Spriggs writes: I knew Dr. Killick Millard for over 40 years, and I have seldom met any man with such enthusiasm and energy. Through his letters to the medical journals on temperance, vaccination, cremation, birth control, and voluntary euthanasia he must be known to hundreds of the profession who never met him personally. He was never afraid to champion an unpopular cause in public debate or in private conversation. I have heard it said (most unjustly) that he did not believe in vaccination against smallpox. The view he adopted when he was M.O.H. of Leicester was that, as many outbreaks of smallpox were initiated by a mild case in a person not sufficiently protected by vaccination, and as at least nine out of ten persons in Leicester were unvaccinated, or had only been vaccinated in infancy, he would rather deal with a population wholly unvaccinated, which (he held) would be unlikely to throw up mild and atypical cases of smallpox which might be missed. If, however, a case did occur, there was no one more energetic than Millard in tracing and vaccinating every contact.

Millard gave himself a motor-cycle on his 80th birthday, and soon after getting it he went to Scotland and back to visit a daughter. He enjoyed the trip, alleging that it was more exhilarating than sitting in a car. When asked why he unnecessarily used an "L" sign on his motor-cycle, however, he confided in me that he was not quite so agile as of yore, and that the L sign made others on the road more careful.

In his youth Millard had been interested in ornithology. Good specimens of rare birds stuffed by him some 60 years ago can still be seen at his home. Millard's life-long hobby, however, was gardening. When he was appointed M.O.H. at the age of 31 he went into a residence adjoining the Fever Hospital which had an acre of ground. This he

converted with his own hands into a delightful garden, planting many fruit trees which are now quite large. In a pond, quite near the house, but well shaded, wild duck bred for many years, and were treated as pets by his growing family. The flower-beds, lawns, fruit trees, and vegetables were all attended to by himself alone till about two years ago. Also he had several beehives which he made and attended to himself. For some years he led a gardening "group" of the Rotary Club. The members met every month during the summer and discussed gardening matters, including the "compost heap," in which he was a firm (though not a fanatical) believer. One man who attended the group regularly, but who was no sort of gardener, when asked why he came, replied, "It does me good to see Dr. Millard's energy and enthusiasm, though he is much older than I. When I leave one of these meetings I feel years younger."

Perhaps the most outstanding feature in Millard's character was his conscientiousness and sense of duty: he would regard any attempt at tax evasion or similar action with loathing, and would always, when on official business, travel by the cheapest possible route so as to save public expense. He had a strong love of truth and a logical approach to any new problem rather unusual in an enthusiast, such as he certainly was.

Dr. E. B. Berenice Humphreys writes: The death of Dr. C. Killick Millard recalls to my mind many pleasant memories of an association which extended over a period of some 22 years. At the time when I joined the staff of his department in 1929 he was a national figure in the world of public health. He startled the daily newspapers with his presidential address to the Society of Medical Officers of Health by his views on voluntary euthanasia, while at the same time he was preparing for his local health committee a detailed report on the overcrowding in his city, illustrating his notes with actual photographs of families of eight and ten persons living in one room and enunciating a theory, at that time unorthodox, of differential rents as essential in any scheme of rehousing. He always contended that a new house alone would not suffice for these large families, unused to the amenities which would then be afforded to them. To many of them he was a constant and welcome visitor in their new surroundings; he it was who helped them to plan and to stock their new gardens. His car was often laden with plants and sacks of seed potatoes which he himself had raised for them. His garden was his greatest hobby, and all of us in the health department shared his joy in the beautiful flowers he brought for us almost each morning. We also remember the generous hospitality he and his gracious wife afforded to each and every member of the staff, how the year was punctuated with daffodil time, rose time, strawberry time, and chrysanthemum time. Fortunately for us he remained on in his home at "The Gilroes" after he retired, and so could spend more time working in his beloved garden. To the end he continued to share with us the fruits and flowers and the honey that his garden provided.

His very strict ethical sense forbade him to enter into any discussion on the work of the health department after he had retired, but his interest in public health remained undiminished. His work as a district medical officer in the County of Leicester kept him actively in touch with preventive medicine, and he was a regular attendee at the monthly meetings of the East Midlands Branch of the Society of Medical Officers of Health at Nottingham. It was my privilege to drive him to these meetings, usually along a route in Leicestershire which was very familiar to him and recalled the scenes of his upbringing in a country rectory. He loved the countryside in every season of the year and taught me to appreciate, on that journey, the beauty of familiar trees in their nakedness in winter as well as their full leaf in summer. More than once in the autumn we have silently hastened back to be in time to see the sun go down over a familiar stretch of water on the edge of Charnwood Forest.

Last autumn he wrote me a note to say he was afraid that unless his health improved he would not be able to make these monthly journeys but that they would remain with him as very pleasant memories. Reluctantly at last he resigned himself to an indoor life and the novelty of his television set. But in the last weeks of his long and active life he came to cease to look back upon that life. Rather did he contemplate with faith and trust the unknown life that was to follow. And so, surrounded by a wealth of spring flowers which he himself had planted, he passed peacefully and confidently into that fuller life.

Sir RICHARD LUCE, K.C.M.G., C.B., F.R.C.S.

The death of Sir Richard Luce on February 22 was recorded in the *Journal* of March 1 (p. 493). We are indebted to Dr. F. G. Lescher, of Derby, for the following appreciation:

The death of Sir Richard Luce caused deep regret among his more senior colleagues in Derby and Derbyshire, who had worked happily with him. He had deservedly a large consulting practice, and he was a friend to many doctors in the district. His greatest hobby was the study of military science. As a Territorial officer he founded the 1st North Midland Field Ambulance in 1909. His keenness was such that he invariably had with him a succession of military textbooks which he used to study when on his rounds and between seeing his patients. His Saturday afternoons and evenings were spent training the three field ambulances under his command, for he was one of those who considered a war inevitable. He was A.D.M.S. of the 46th Division at the outbreak of the first world war. Lord Allenby, who did not suffer fools gladly, was so struck by his ability and enthusiasm during his service in France that he took him to Egypt as D.D.M.S. of a corps. Later Lord Allenby insisted, in spite of opposition that Luce was a Territorial and not a regular officer, on his appointment as D.M.S. of the Egyptian Expeditionary Force, which included the Mediterranean area as well. With the rank of major-general, Luce was the first Territorial to occupy such a high post. It gave him his great opportunity, with the result that the medical service of this Army was raised to a peak of excellence unsurpassed in any other theatre of war. There had been some previous trouble in Egypt with the medical consultant services. Luce, since he was a wise doctor as well as a capable administrator, solved this; and the decorations which were bestowed on him were indeed well earned.

After the war, on his return to his surgical practice, he was elected president of the Derby Medical Society for the second time, an unprecedented honour. He still took an interest in military matters, being appointed honorary colonel of the medical services of the 46th North Midland Division. I remember taking him to an important divisional staff exercise. A difficult tactical problem, not a medical one, was being discussed, without a decision being arrived at. Luce was asked by the divisional general for his views. With the aid of a blackboard he gave a correct solution after a highly technical explanation. Had he not been a surgeon, Luce would have advanced far as a soldier.

His other hobby was medical politics, and at B.M.A. meetings he outlined a hospital policy not unlike the present one. It was for this mainly that he retired from the active staff of the Royal Infirmary, an institution which he loved and for which he had done so much, two years before his time would have been up, in order to enter Parliament.

W. F. FEDDEN, M.S., F.R.C.S.

Mr. W. F. Fedden, consulting surgeon to St. George's Hospital and to the Victoria Hospital for Children, died suddenly on March 12 at his home in Putney. His health had not been good in recent years.

Walter Fedde Fedden was the son of the late Samuel Fedden, and was born at Weston-super-Mare in 1879. He was educated at St. Paul's School under the celebrated and formidable F. W. Walker, whence he entered St. George's Hospital Medical School with a scholarship for his medical course. There he won many prizes and scholarships, and qualified in 1900. In 1902 he graduated M.B., B.S. of London University, with honours. He became F.R.C.S. in 1903 and obtained the M.S. in 1904. For a time he was attracted towards E.N.T. surgery, but soon turned to general surgery. After the usual resident appointments he became surgical registrar at St. George's, and then assistant surgeon, full surgeon, and consulting surgeon in the normal sequence. He retired from practice in 1935. For very many years he was surgeon to the Victoria Hospital for Children: his work there was, if anything, ever nearer to his heart than that at St. George's, and his handling of a sick child was an object-lesson in that not always easy art. He was also for a long time surgeon to the Bolingbroke Hospital, and during the 1939-45 war he emerged from retirement to resume surgical work there.

Fedden was a man of massive build, with big hands and a big head as well as a large frame. A certain deliberateness of movement and of speech was his habit; but it was far from an indication of a slow intelligence. His hands, too, were capable of most delicate and dexterous craftsmanship, and his operative technique was both carefully thought out and admirable in execution. Among his colleagues he was a man to whom many of them turned immediately for advice if they themselves or those near them stood in need of surgical care. As a teacher he was very conscientious and thorough, but rather eschewed the dramatic. During the 1914-18 war he served in the medical service of the Royal Navy as an officer of the R.N.V.R., and for a short time after the war he was on the Naval Medical Service Subcommittee of the Services Committee of the B.M.A. He had been an examiner in surgery for Cambridge and London Universities, and had edited the sections in *Gray's Anatomy* dealing with applied anatomy.

In 1921 he married Miss S. M. Haines, only daughter of the late Rev. William Haines. His wife survives him; there were no children of the marriage.

G. P. MILLS, F.R.C.S.

Mr. George Percival Mills, who died on March 7 at the age of 68, at his home at Shrawley, Worcestershire, had been living in retirement for several years. He was well known in Birmingham and throughout the Midlands, first as a general surgeon and later as an orthopaedic surgeon, and was for some years lecturer in orthopaedics in the University of Birmingham. Born at Walsall on July 18, 1883, he came from Harrow to the medical school at Birmingham, where he had a most distinguished career as a student. He qualified M.R.C.S., L.R.C.P. in 1906, and in the same year obtained the degrees of M.B., B.S. of the University of London, graduating with honours in zoology and surgery, and gaining the gold medal in anatomy. Two years later

he was admitted a Fellow of the Royal College of Surgeons of England. Except for a period as house-surgeon at the Hospital for Sick Children, Great Ormond Street, London, the whole of his work in general surgery was carried out at the General Hospital, Birmingham, where he steadily climbed the surgical ladder from house-surgeon to consulting surgeon, retiring in 1938. Mills was a skilful, patient, and ingenious craftsman. The problems of orthopaedic surgery always appealed to him, and an appointment on the staff of the Birmingham Orthopaedic Hospital gave him the opportunity to develop this work, which eventually became his main interest. There is no doubt, however, that his training in general surgery, the broader problems of which still intrigued him, gave him a sound and mature judgment in his specialty. His help was much appreciated by his colleagues in dealing with difficult cases of bone and joint disease and injury and with the problems of the wounded man. During the war of 1914-18 he spent three years in Serbia, with many of his colleagues from Birmingham, on the staff of the 47th General Hospital, where he saw more dysentery and malaria than surgical cases. For his services he was awarded the Serbian Order of St. Sava.

For many years Mills was a member of the Moynihan Chirurgical Club, and greatly enjoyed his visits with colleagues to many of the great surgical centres of Europe. His critical mind and independent outlook helped his fellow members to make a clear appraisal of the work they had been seeing, and these qualities made him a valued member of the party. Mills retired somewhat early in his professional career, owing to deterioration in health, but he maintained an active interest in the affairs of the countryside, which he deeply loved. His retirement was enriched by a happy home life, by his hobbies (of which fishing came first), and by a cultured taste in music and literature. He leaves a widow and two sons and two daughters. Both sons are members of the medical profession, in which they have already achieved distinction. Mrs. Mills and her family have the sympathy of their many friends.—S. G. B.

JOHN DUNDON, F.R.C.S., F.R.C.S.I.

Professor John Dundon, who died on February 24, at the age of 81, was born at Kilworth, Co. Cork, in 1871, the youngest son of Mr. Edmond Dundon, of Araglen Mills. He was educated at the Christian Brothers' College and at what was then Queen's College, Cork, where he was a senior exhibitioner and scholar. He graduated M.B., B.Ch., with first-class honours, at the old Royal University of Ireland in 1894. Dundon was appointed surgeon to the Mercy Hospital, Cork, in 1898, the year in which he was elected F.R.C.S.I., and from 1900 to 1915 he was surgeon to the North Cork Infirmary, to which he later became consulting surgeon. He occupied the chair of therapeutics and materia medica at University (formerly Queen's) College, Cork, from 1900 to 1927, when he became professor of surgery, holding the latter appointment until his retirement in 1940. He became a Fellow of the Royal College of Surgeons of England in 1905. Dundon was at one time an examiner in surgery for the Conjoint Board in Ireland and for some years was a member of the Irish Medical Registration Council, to which he was first appointed in 1927. He was a member of the Senate of the National University of Ireland from 1929 to 1939. When the British Medical Association

met at Liverpool in 1912 he acted as secretary of the Section of Pharmacology and Therapeutics. He married May, youngest daughter of Mr. John M'Donnell, of Cork, in 1910.

A former student writes: Professor John Dundon was one of the outstanding medical men in the south of Ireland in this half-century; indeed, he was almost a legendary figure. Many of his operations were performed in private houses in remote country districts, involving long journeys from Cork. For many years he worked for sixteen to eighteen hours daily. He was an extremely dexterous operator, but did not believe in showmanship and never sought praise. His direct and logical approach to clinical problems caused students to crowd his ward-rounds long before he became professor of surgery in Cork in 1927. He was an excellent teacher, stimulating but never impatient or unkind. Indeed, his personal kindness matched his professional skill and he always avoided publicity in practising that virtue. His students and his patients ever found him tolerant and understanding. His was a truly great character.

G. E. BLOCH, M.D.

The death of the Danish scientist, Professor Carl Edvard Bloch, on February 11 comes as a reminder of the important part he played before, during, and just after the first world war in the discovery of vitamin A. He was born on September 21, 1872, and began to make his mark quite early in life by his studies, in association with Knud Faber, of pernicious anaemia and diseases of the intestinal tract. In his thesis, composed in 1902, "Studies of Intestinal Inflammation," he criticized the theory that pernicious anaemia is due to intestinal atrophy. In December, 1916, at a meeting of the Medical Society of Copenhagen, he presented the clinical evidence he had collected in support of his theory that xerophthalmia is due to lack of a nutritional factor present in fats. As pointed out in a recent Danish obituary notice, Bloch was the first to demonstrate by clinical observations the existence of vitamin A. This claim is not invalidated by the fact that McCollum and Davis, and Osborne and Mendel, had already demonstrated by experiments on animals the existence of a xerophthalmia-preventing vitamin. Their work, of which Bloch was ignorant at the time, did much to supplement and confirm his findings. Bloch was appointed acting Professor of Paediatrics in 1916, and "ordinary" Professor in 1931. He took an active part in the administrative work of the University in Copenhagen, and even after his retirement in 1943 he continued as an examiner in medicine at the University.

MICHAEL HESELTINE, C.B.

We record with regret the death on March 13, after a short illness, of Mr. Michael Heseltine, who was registrar of the General Medical Council from 1933 until June, 1951.

Michael Heseltine was born in 1886 in Norfolk, the son of the Rev. Ernest Heseltine. He was educated at Winchester and at New College, Oxford, where he read Greats. He was an accomplished classical scholar, and at a later date contributed to the Loeb Classical Library an admirable and idiomatic translation of Petronius. In 1909 Heseltine was appointed to the administrative class of the Home Civil Service, and after serving in the Office of Works and the Home Office was transferred

in 1912 to the newly constituted National Health Insurance Commission (England). Sir Robert Morant had gathered together a number of young administrators, many of whom afterwards rose to high rank in the public service, and among them Heseltine became known as one of the most able and promising. In 1919 he was awarded the C.B. After being seconded to the Ministry of Munitions and the Ministry of Reconstruction, Heseltine was transferred in 1919 to the newly established Ministry of Health, in which he served until 1933. In 1928 he was promoted to the rank of assistant secretary, and thereafter was largely responsible for the supervision of medical benefit under the National Health Insurance Acts and for the administration of insurance committees. Throughout his Civil Service career Heseltine's exceptional ability as a draftsman was given full scope in a series of appointments as secretary of important commissions and committees, including the Haldane Machinery of Government Committee (1917) and the Onslow Royal Commission on Local Government (1923-8). From 1928 to 1933 he represented the Minister of Health on the Dental Board of the United Kingdom.

In 1933 Heseltine left the Civil Service and became Registrar of the General Medical Council, and also of the Dental Board of the United Kingdom. He ceased to be registrar of the board on the appointment of a whole-time registrar in 1946, but remained registrar of the Council until June, 1951. During his long and distinguished tenure of office as registrar of the Council Heseltine had to deal with an immense variety of problems affecting medical education, medical registration, and medical discipline. Committees found him at all times experienced, resourceful, and imperturbable. During the war the Defence Regulation providing for the temporary registration of Commonwealth and foreign doctors threw an especial burden upon him at a time when the office of the Council had been bombed and staff was depleted. When evidence was required from the Council or the Board for such bodies as the Inter-departmental Committee on Medical Schools (Good-enough Committee) or the Inter-departmental Committee on Dentistry (Teviot Committee) his lucid and comprehensive memoranda, written in that dignified and rhythmical style of which he was a master, were often produced under conditions of considerable difficulty and pressure.

Heseltine's work as Registrar of the Council culminated in the passing of the Medical Act, 1950. In the Second Reading debate in the House of Lords Lord Hacking, who for 15 years had been a lay member of the Council, paid a special tribute to Heseltine "for the great part which he played from the very commencement of the discussions until their successful completion some months ago." After retiring from the post of registrar, shortly before his 65th birthday, Heseltine continued at the Council's request to conduct research and write on the history of medical education and other activities of the Council, and the office of Librarian was created for him for this purpose.

Dr. C. St. J. de Vere Shortt writes: All those who ever attended the clinical lectures of Dr. A. R. PARSONS will be deeply touched by his death, recorded in the *Journal* of March 8 (p. 549). He had a technique of his own, and the crowds of students who frequented his clinics testified to his

popularity and his great gift of teaching medicine. At two minutes to nine every Monday, Wednesday, and Friday, not a minute later, Parsons would come into the hall of the Royal City of Dublin Hospital (known to students as Baggot Street) with his brisk walk, and immediately proceed to the ward where he was to give his lecture. From the moment he started he held one's interest, and if he did at times make you feel small before a class of students it was just "Alfie," and nobody minded, for everyone loved him and thought the world of him. He had the most marvellous memory. He would take the class to a bed where a patient was lying unconscious and proceed to give a complete list of every cause of unconsciousness which could be found in any textbook. His prescribing was superb, no mist. sod. sal. or other mists, for him. Every prescription was written out in full with meticulous care. His knowledge of skin diseases was unique. It would be impossible to forget his lectures: one moment he would be speaking in a tone of pathos and drama, and the next in tones of wonderment and astonishment, holding your interest till the last moment, when he would "reveal the oracle." Dublin has lost a great physician, an outstanding teacher, and one whose shoes it will be hard to fill. Hundreds of doctors who have been associated with him during the 58 years he has been physician to Baggot Street will feel that they have lost a great friend to whom they owe much of their learning, to whom they will be for ever grateful.

Dr. THOMAS HENRY BISHOP, of 94, Portland Place, London, died on March 2. He qualified M.R.C.S., L.R.C.P. in 1902 and worked for some time in Newcastle-upon-Tyne as medical officer to the City Dispensary. He took his D.P.H. (Durham) in 1905 and went to India as medical officer to the Kolar Gold Fields in the Bombay Presidency. Later he became chief medical officer to the Hardinge Bridge construction project. During this time he made a special study of cholera and described an original method of intravenous saline administration in the treatment of this condition. On the completion of the Hardinge Bridge he became chief medical officer of the Eastern Bengal State Railway. In 1914 he joined the I.M.S., from which he retired with the rank of Major in 1918. He spent the first year or more at the Indian Hospital in Brighton and was then sent to the Persian Gulf, where he spent the remainder of the war apart from when he was invalided home after two severe attacks of cholera. For some time he was civil surgeon of Basra and assistant director of the civil health services in Iraq. One of his patients was the influential Sheikh of Mohammerah, who requested the British authorities that Bishop should accompany him as his medical adviser on a pilgrimage to Ispahan. He thus became well acquainted with conditions and personalities throughout Persia and Iraq. After the war he returned to his post in the Indian State Railways and was elected president of the Railway Chief Medical Officers' Conference. During this time he made a detailed study of methods of water purification and published papers on the subject. On his retirement from India in 1928 he returned to England and occupied himself with a number of medical interests. He edited a journal called the *School Medical Officer*, spent a year in Canada, and renewed his Persian and Mesopotamian contacts. In 1935 he was appointed medical adviser to the Iraq Petroleum Company, a post which he held until his death. He was also medical adviser to Trinity College of Music. Though he was a humble man of simple tastes he had a great sense of loyalty and duty to his patients and those who came to him for advice. In his many contacts with specialists and consultants in the course of his work in the latter part of his career he was persistent and determined that the patient should derive the fullest benefit from the consultant's skill and experience. Though for some years he had been in failing health his only reaction to it was impatience and apprehension that it should interrupt his work. He was granted his greatest wish—to die in harness. He is survived by an only son, Dr. P. M. F. Bishop.

Medical Notes in Parliament**Preventing Burns**

Mr. DENYS BULLARD, on March 14, moved the second reading of the Heating Appliances (Fireguards) Bill. He said its aim was to prevent the large number of accidents from burning in the home. These were perhaps the most serious of home accidents. The number of fatalities had been reduced by modern treatment, but, especially among old people and children, the number of serious or fatal accidents was still too high. All the deaths in the home were not the sole responsibility of the gas and electric fires and of the oil-stoves covered in the Bill. The open coal grate was still the greatest cause of fatal burning accidents in the home. The provision in the Children and Young Persons Act, 1908, placing a penalty upon parents of children involved in fatal accidents from fires in the home was not operative. The Bill empowered the Home Secretary and the Secretary of State for Scotland to lay down standards for the construction and fitting of guards to electric and gas fires and oil stoves. After an appointed day it would become an offence to sell any of these heating appliances unless they were adequately guarded according to the standards laid down.

Dr. SOMERVILLE HASTINGS, Dr. HORACE KING, and Dr. A. D. D. BROUGHTON supported the Bill, which was read a second time without a division.

Industrial Dermatitis

Dr. BARNET STROSS asked Mr. Peake on March 10 if he knew that some of his insurance officers appealed against every case in which a worker was certified to be suffering from industrial dermatitis, that there was a considerable delay before the worker was examined by the medical tribunal, and that certifying surgeons serve no useful purpose while this practice continued. Mr. OSBERT PEAKE replied that the great majority of claims for benefit for industrial dermatitis were decided by insurance officers on the basis of the examining medical practitioner's report.

Dr. EDITH SUMMERSKILL suggested that the trouble was partly due to a shortage of dermatologists. She asked Mr. Peake to bring this to the attention of the deans of the medical schools.

Mr. PEAKE promised to consider this suggestion.

Hospital at Aden

Mr. JOHN RANKIN inquired on March 12 why the plan for a new hospital at Aden had been abandoned, and when the tuberculosis wards to be built at Khormaksar would be ready for use. Mr. OLIVER LYTTTELTON said this plan had not been abandoned. It was still proposed to construct a new 480-bed hospital at Khormaksar as rapidly as difficulties of finance and shortage of technical staff could be overcome. A sum of £600,000 was included in the present Aden Colony Development Budget towards the building of this hospital. Tuberculous patients were already adequately provided with wards at the present hospital, and would probably remain there until the major part of the new hospital had been built.

Prescription Charges

Mr. P. A. D. BAKER, on March 14, asked the Minister of Health to exempt from the prescription charge rural doctors dispensing their own prescriptions. Mr. H. F. C. CROOKSHANK replied that it was intended that the charge should be paid by the patient. He said it would not be equitable to exempt from the charge such patients as happened to get the medicine from dispensing doctors. Mr. Crookshank added that he was about to discuss the doctors' difficulties with the British Medical Association.

Medico-Legal**PENDULUM SWINGING**

[FROM OUR MEDICO-LEGAL CORRESPONDENT]

In his judgment in a case before the Circuit Court at Longford, in Ireland,¹ Judge Binchy stigmatized as "quackery and humbug" the conduct of J. H. Bennett, of Newtown Forbes, Longford.

The action was brought in respect of the death of Christopher Brogan, aged 33, from tuberculosis. Brogan was admitted to Longford Tuberculosis Hospital as an advanced case in January, 1950, but made good progress. When his relations visited him in June they found him reading a pamphlet entitled *T.B. Conquered*, by Bennett, and he expressed a wish to try the treatment offered in the pamphlet. The relations went straight to Bennett's house, and Bennett said he could cure him. He said he would x-ray him, and produced a string with a brass weight on the end which he swung in front of his face. Asked how he could x-ray an absent person with that, he said he could x-ray a person at the end of the world with it.

Bennett said that Brogan must leave hospital and go home, and gave the relations a jar of "medicine," warning them not to let any medical man get his hand on it, because he had refused to sell the formula to the Medical Board in Dublin, as it would be available only for rich people.

Brogan left hospital against the advice of the medical superintendent soon afterwards. He took the diet advised by Bennett—carrageen moss, boiled flaxseed, white of egg, and water. His relations visited Bennett's house several times. The pendulum was swung each time, and each time they were told there was a slight improvement in the patient. In October, 1950, Brogan died of pulmonary tuberculosis soon after Bennett had told his brother that he was completely cured and could get up.

In dismissing the action against Bennett on the ground that both Brogan and his parents had voluntarily submitted to Bennett's treatment, Judge Binchy said it was amazing that in the twentieth century someone could pretend to cure illness by twiddling the weight and pretend to tell the condition of the patient, whom he never saw from start to finish. Bennett's fee for the treatment was £20.

On March 12 the case came before the High Court at Longford, when Mr. Justice Kingsmill Moore reversed the previous decision.² He held that Brogan's death was caused or accelerated as a result of treatment and diet prescribed, and he assessed damages at £200, to be divided equally between the father and mother. He also agreed to state a case for the Supreme Court.

Universities and Colleges**ROYAL COLLEGE OF SURGEONS OF ENGLAND**

At a meeting of the Council of the College held on March 13, with the President, Sir Cecil Wakeley, in the chair, a Hunterian Professorship was awarded to Mr. K. W. Starr; the Hallett Prize was presented to Mr. J. C. N. Wakeley (King's College Hospital); and the award of a Streatfeild Research Scholarship to Mr. A. T. Andreasen was reported.

A Diploma of Fellowship was granted to Mr. Anthony Owen Parker, of Sydney, Australia. (Mr. Parker's name has been confused with that of Mr. Arthur Orfeur Parker, of Wonastow, near Monmouth, who last year was elected to the Fellowship without examination as a medical practitioner of at least 20 years' standing.)

A Diploma of Membership was granted to Mr. Anthony Peter Coats Bacon (St. Thomas's Hospital).

The following hospitals were approved for the surgical training of candidates for the Fellowship examinations of the College: Beckett Hospital, Barnsley, orthopaedic registrar, for six months; Pontefract General Infirmary, surgical registrar for one year; resident surgical officer and house-surgeon for six months.

CONJOINT BOARD IN SCOTLAND

The following candidates, having passed the final examination, were admitted L.R.C.P.Ed., L.R.C.S.Ed., and L.R.F.P.&S.Glas., on March 8: J. C. Aickin, I. S. Arthur, T. Awuku-Asabre, J.-H. Beatty, J. Berlow, W. N. Brady, C. M. S. Calder, D. I. Cowan, J. Davies, Valerie P. Fogg, A. B. Gwan-Nulla, Mary Iball, Agnes Kramer, Catherine S. MacGregor, I. MacIntyre, Cecily R. Murray, Eileen Reddy, Ferenc Sandor, W. Scott, Sheila Sweeney, A. C. Thomson, W. Welsh, Joan W. Whitaker, S. M. Young.

Vital Statistics

Smallpox in Lancashire

The infection of variola minor remains confined to Rochdale County Borough and the adjoining districts. Although numerous suspected cases had been investigated up to noon on March 18, there was no confirmation of the presence of the disease elsewhere in the country. Uncorrected notifications received at the General Register Office this year up to March 15 numbered 94. There have been no deaths.

Notifications of smallpox received by the General Register Office this year are as follows: in the week ending February 16, 1; February 23, 18; March 1, 7; March 8, 62; and March 15, 6.

Graphs of Infectious Diseases

The graphs below show the uncorrected numbers of cases of certain diseases notified weekly in England and Wales. Highest and lowest figures reported during the nine years 1943-51 are shown thus ----, the figures for 1952 thus —. Except for the curves showing notifications in 1952, the graphs were prepared at the Department of Medical Statistics and Epidemiology, London School of Hygiene and Tropical Medicine.

Infectious Diseases

In England and Wales during the week ending March 1 an increase was reported in the number of notifications of measles 499, whooping-cough 141, and dysentery 56, while a decrease was recorded for scarlet fever 107 and acute pneumonia 82.

The largest increases in the number of notifications of measles were Gloucestershire 147, Yorkshire East Riding 135, and Warwickshire 89, and the largest decrease was Staffordshire 159. Only small changes were recorded in the local trends of scarlet fever, with the exception of a decline of 61 in the number of notifications in Lancashire. The largest variations in the returns of whooping-cough were a rise of 32 in Surrey and in Essex. The number of notifications of diphtheria were 4 fewer than in the preceding week. The chief feature of the returns of diphtheria was a decline of 4 in Lincolnshire and Yorkshire West Riding.

The number of notifications of acute poliomyelitis were 6 more for paralytic cases and 1 fewer for non-paralytic cases than in the preceding week. The largest return was Lancashire 5 (Liverpool C.B. 3).

The number of notifications of dysentery was the largest reported for the past 38 weeks. The outbreak of dysentery in Norwich C.B. is at a constant level; 62 cases were notified in each of the past three weeks. In the past 15 weeks 1,118 cases have been notified from this city. The largest centres of infection during the week reviewed were Lancashire 101 (Manchester C.B. 24, Oldham C.B. 17, Swinton and Pendlebury M.B. 12); London 82 (Wandsworth 29); Norfolk 67 (Norwich C.B. 62); Middlesex 63 (Enfield U.D. 18); Glamorganshire 40 (Cardiff C.B. 40); Yorkshire West Riding 32 (Bradford C.B. 12); Northumberland 27 (Newcastle-upon-Tyne C.B. 21); Southampton County 26 (New Forest R.D. 19); Yorkshire North Riding 25 (Middlesbrough C.B. 25); Surrey 22 (Malden and Coombe M.B. 11); Essex 22.

Week Ending March 8

The notifications of infectious diseases in England and Wales during the week included: scarlet fever 1,581, whooping-cough 2,918, diphtheria 38, measles 6,883, acute pneumonia 1,143, acute poliomyelitis 19, dysentery 639, and paratyphoid fever 6.

INFECTIOUS DISEASES AND VITAL STATISTICS

Summary for British Isles for week ending March 1 (No. 9) and corresponding week 1951.

Figures of cases are for the countries shown and London administrative county. Figures of deaths and births are for the 160 great towns in England and Wales (London included), London administrative county, the 17 principal towns in Scotland, the 10 principal towns in Northern Ireland, and the 14 principal towns in Eire.

A blank space denotes disease not notifiable or no return available.

The table is based on information supplied by the Registrars-General of England and Wales, Scotland, N. Ireland, and Eire, the Ministry of Health and Local Government of N. Ireland, and the Department of Health of Eire.

Medical News

The Rh Blood Groups and their Clinical Effects.—Under this title the Medical Research Council published in 1948 as Memorandum No. 19 a useful guide to the theory and practice of Rh group testing written by Drs. P. L. Mollison, A. E. Mourant, and R. R. Race. A revised edition was issued a few days ago as Memorandum No. 27. The changes are very minor, and consist chiefly in bringing the memorandum up to date with recent references. The new price (3s.) is, however, double the old, a sign of the sad way the cost of paper has risen in three years.

Employment of Older People.—The Minister of Labour told the House of Commons on February 21 that he had decided to set up a national advisory committee on the employment of older men and women. The names of those who will serve on the committee have now been announced; among them are Dr. G. E. Godber, of the Ministry of Health; Dr. E. R. A. Merewether, of the Ministry of Labour; Dr. J. H. Sheldon, director of medicine at the Royal Hospital, Wolverhampton; Dr. Donald Stewart, chief medical officer of the Austin Motor Company; and Sir Frederic Bartlett, director of the Psychological Laboratory at Cambridge.

Foot Health.—Britain's Second National Foot Health Week will be held from June 16 to 21. Since the first National Foot Health Week the Foot Health Educational Bureau has broadened the basis of its educational work, and its advisory panel now includes members from various professions concerned with foot care—medicine, surgery, chiropody, physical education—as well as members from the shoe and leather trades, together with observers from the Ministry of Health and the Ministry of Education. The purpose of the week is to give the general public guidance, in the simplest possible terms, on foot care and footwear. In addition to foot health news and articles in newspapers and periodicals, there will be a four-day exhibition in London, staged at the Exhibition Galleries, Army and Navy Stores, S.W.1, from June 17 to 20.

Federation to Help the Disabled.—In 1950 the World Veterans' Federation was organized in Paris, operating under the United Nations, to help disabled ex-Servicemen. Through its international organization equipment available in the United States for those who have lost limbs or sight, for paraplegics and other paralysed patients, will be sent for distribution in 11 countries. Already the Federation includes some 14 million ex-Servicemen from 14 nations, and its principles, which include the maintenance of peace with freedom, have been accepted by nearly 90 member-associations. At the inaugural conference held in Belgrade last November—to which British ex-Servicemen's associations sent observers although Britain is not yet an official member of the Federation—the delegates decided to adopt as their major activity the rehabilitation of the disabled veteran. Mr. Kurt Jansson has been appointed director of rehabilitation and Dr. Harold Balme has been invited to become consultant adviser. The Federation, which has considerable funds at its disposal as well as much political influence in most countries, will work in close co-operation with both the United Nations and the World Health Organization. A conference is being planned to discuss plans of activity, and this will be held in Paris next month.

New Metabolic Ward at U.C.H.—The medical school and the majority of laboratories at University College Hospital are in a separate building across the road from the wards themselves. To make investigation and research easier a metabolic ward has now been opened in the hospital under Professor M. L. Rosenheim and Dr. C. E. Dent, where laboratories and bedrooms are adjacent in the same corridor, and studies of obesity and endocrine function can conven-

ently be carried out without disturbing either patients or laboratory workers. This is particularly valuable at a time when biochemistry is ever-increasing in importance in clinical medicine. The ward is shared with Dr. E. E. Pochin's group, who are studying the therapeutic use of radio-isotopes (see also p. 648).

Sheriffs.—Drs. T. E. Jones-Davies and R. Davies Jones have been appointed Sheriffs for 1952 for Carmarthenshire and Montgomeryshire, respectively.

Emergency Bed Service: Applications and Admissions.—During the seven days ending March 17 the number of applications made by doctors to the London Emergency Bed Service for admission of patients was 989, of whom 87.05% were admitted.

COMING EVENTS

Ophthalmological Society.—The annual congress of the Ophthalmological Society of the United Kingdom will be held at the Royal College of Surgeons of Ireland, Dublin, from April 17 to 19. The annual dinner will be held at the Gresham Hotel on April 18, price 30s. per head; application should be made before March 29, and full details of the congress may be obtained from the secretary of the society, 45, Lincoln's Inn Fields, London, W.C.2.

Dietetics Congress.—The first international congress of dietetics will be organized from July 7 to 11 inclusive, in the Royal Tropical Institute, Amsterdam, Netherlands. Those interested are requested to apply for further details to Miss Diane J. Ten Haaf, General Secretary, Executive Committee, 13, Pomonaplein, The Hague, Netherlands.

Clinical Pathologists.—The annual general meeting of the Association of Clinical Pathologists will be held at Portsmouth (in the City Council Chambers) from April 3 to 5. Full details from the secretary, Dr. W. H. McMenemey, Maida Vale Hospital for Nervous Diseases, London, W.9.

International Haemophilia Society.—The annual general meeting of the society has been fixed for April 20, at 2 p.m., in the small assembly room of St. Pancras Town Hall. Any doctor who is interested is invited to attend, and full details are available from the society's office, the Old Fire Station (Top Floor), 94, Southwark Bridge Road, S.E.1.

Care of Old People Conference.—The National Old People's Welfare Committee announces that the sixth national conference on the care of the elderly will be held at the Olympia Ballroom, Scarborough, from April 3 to 5. Full details from the secretary of the committee, 26, Bedford Square, London, W.C.1.

Institute of Psychiatry.—Details of the lectures to be given to postgraduate students in psychiatry at the Maudsley Hospital during the term beginning on April 7 are now available from the secretary of the Institute, Maudsley Hospital, S.E.5.

Digestive Pathology Conferences.—A series of lectures and demonstrations on various aspects of digestive pathology will be held in Paris from May 26 to July 8, organized by the Faculté de Médecine de Paris and the Société Nationale Française de Gastro-entérologie.

May 26 to June 9: Liver and pancreas.

June 10 to June 23: Oesophagus, stomach, and duodenum.

June 24 to July 8: Intestines, rectum, and anus.

Full details from Dr. François Moutier, 78, rue de Monceau, Paris, 8^e.

Radiology Courses.—The Faculty of Radiologists is organizing courses for the candidates for the D.M.R.D. and D.M.R.T. (R.C.P.Lond. and R.C.S.Eng.), beginning in October. Further details may be found in the advertisement columns.

Prize for X-ray Therapy.—A David Anderson-Berry silver-gilt medal, together with a sum of money amounting to about £100, will be awarded in 1953 by the Royal Society of Edinburgh to the person who in the opinion of the council has recently produced the best work on the therapeutical effect of x rays on human diseases. Applications may be based on both published and unpublished work and should be accompanied by copies of relevant papers. They must be sent to the general secretary, Royal Society of Edinburgh, 22, George Street, Edinburgh, 2, by March 31, 1953.

SOCIETIES AND LECTURES

A fee is charged or a ticket is required for attending lectures marked ●. Application should be made first to the institution concerned.

Friday, March 21

SOCIETY OF CHEMICAL INDUSTRY: FINE CHEMICALS GROUP.—At King's College, Strand, London, W.C., 7 p.m., A.G.M.; 7.30 p.m., "The Physico-chemical Aspects of Drug Administration," by Dr. N. Evers.

Monday, March 24

MANCHESTER MEDICAL SOCIETY: SECTION OF GENERAL PRACTICE.—At Large Anatomy Theatre, Medical School, Manchester University, 9 p.m., "The Problem of Peptic Ulceration in General Practice," by Dr. C. E. S. Lynch.

MANCHESTER MEDICAL SOCIETY: SECTION OF ODONTOLOGY.—At Manchester Dental Hospital, 5 p.m., "A Study of the Innervation of the Developing Tooth-germ, with Reference to the Innervation of Dentine," by Mr. F. T. Monks.

MEDICAL SOCIETY OF LONDON. 11, Chandos Street, Cavendish Square, W.—8.30 p.m., pathological meeting.

SOCIETY FOR ENDOCRINOLOGY.—At Royal Society of Medicine, 1, Wimpole Street, London, W., 5.30 p.m., "The Role of the Adrenal Cortex in Homeostasis," by Dr. D. J. Ingle (Michigan, U.S.A.).

Tuesday, March 25

● **INSTITUTE OF DERMATOLOGY,** Lisle Street, Leicester Square, London, W.C.—5.30 p.m., "Enzymic Mechanisms in Skin," by Professor R. H. S. Thompson.

● **ROYAL COLLEGE OF SURGEONS OF ENGLAND,** Lincoln's Inn Fields, London, W.C.—5 p.m., "Familial Intestinal Polyposis," Hunterian Lecture by Professor C. E. Dukes.

WEST END HOSPITAL FOR NERVOUS DISEASES, 40, Marylebone Lane, London, W.—5.30 p.m., "When the Electroencephalograph Helps," by Dr. Douglas Gordon.

Wednesday, March 26

● **INSTITUTE OF DERMATOLOGY,** Lisle Street, Leicester Square, London, W.C.—5.30 p.m., "Animal Parasites in Dermatology," by Dr. J. O. Oliver.

INSTITUTE OF UROLOGY.—At St. Paul's Hospital, Endell Street, London, W.C., 4.30 for 5 p.m., "Physical Aspects of Radiotherapy," by Mr. S. B. Osborn.

ROYAL INSTITUTE OF PUBLIC HEALTH AND HYGIENE, 28, Portland Place, London, W.—3.30 p.m., "Malformations and Irregularities of the Teeth and Jaws in Children" (Illustrated), by Miss Rosamond Caseley, L.D.S.R.C.S.

Thursday, March 27

CHADWICK TRUST.—At Public Library Lecture Hall, Chesterfield, 7.30 p.m., "Public Health—A Comparison Between the Age of Chadwick and Our Own," Chadwick Public Lecture by Mr. S. E. Finer, M.A.

● **INSTITUTE OF CHILD HEALTH,** Hospital for Sick Children, Great Ormond Street, London, W.C.—5 p.m., "Surgery of Chest Disease," by Professor R. S. Pilcher.

INSTITUTE OF PSYCHIATRY, Maudsley Hospital, Denmark Hill, London, S.E.—3 p.m., "Affective Epilepsy," public lecture by Professor L. van der Horst (Amsterdam).

LIVERPOOL MEDICAL INSTITUTION, 114, Mount Pleasant, Liverpool.—8 p.m., annual and ordinary meetings. Election of President and Officers. "Cerebral Abscess," by Mr. R. H. Hannah.

LONDON JEWISH HOSPITAL MEDICAL SOCIETY.—At Medical Society of London, 11, Chandos Street, W., 8.30 p.m., "Acute Nephritis," by Professor M. L. Rosenheim.

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, London, W.C.—5 p.m., "The Status of Lymphadenoid Goitre, Hashimoto's and Riedel's Disease," Hunterian Lecture by Professor T. Levitt.

St. JOHN'S HOSPITAL DERMATOLOGICAL SOCIETY, Lisle Street, Leicester Square, London, W.C.—4.15 p.m., demonstration and discussion of clinical cases.

Friday, March 28

● **INSTITUTE OF DERMATOLOGY,** Lisle Street, Leicester Square, London, W.C.—5.30 p.m., "Benign New Growths," clinical demonstration by Dr. H. Gordon.

●INSTITUTE OF DISEASES OF THE CHEST AND INSTITUTE OF CARDIOLOGY.—At London School of Hygiene and Tropical Medicine, Keppel Street, W.C., 5.30 p.m., "*Constrictive Pericarditis*," by Dr. William Evans and Mr. Vernon C. Thompson.

INSTITUTE OF LARYNGOLOGY AND OTOTOLOGY, 330, Gray's Inn Road, London, W.C.—4.30 p.m., clinical discussion for general practitioners. "*Cancer of the Larynx*," by Professor F. C. Ormerod.

MEDICAL SOCIETY FOR THE STUDY OF VENEREAL DISEASES, 11, Chandos Street, London, W.—7.30 p.m., general meeting. "*Fatal Syphilis*," papers by Dr. G. L. M. McElligott and Professor W. D. Newcomb. A discussion will follow.

ROYAL INSTITUTE OF CHEMISTRY: NORTH WALES SECTION.—At Imperial Buildings, Regent Street, Wrexham, 6.30 p.m., "*Cortisone*," by Professor C. W. Shoppee, D.Sc., D.Phil.

Saturday, March 29

LONDON ASSOCIATION OF THE MEDICAL WOMEN'S FEDERATION.—At Courtauld Lecture Theatre, Middlesex Hospital, Mortimer Street, W., 2.30 p.m., clinical meeting by Miss Diana Beck.

BIRTHS, MARRIAGES, AND DEATHS

BIRTHS

Brown.—On March 8, 1952, at Mary's Meadow, Guildford, Surrey, to Barbara (formerly Jacobs), M.R.C.S., L.R.C.P., wife of David Fergieve Brown, a sister for Richard-Janet Filmer.

Ewing.—On February 22, 1952, at St. Anne's Nursing Home, to Evelyn, wife of Dr. Richard F. Ewing, of 1, White Road, Cowley, Oxford, a sister for Michael Charles.

Habibis.—On March 2, 1952, at the Princess Beatrice Hospital, to Dr. Stella Murray, wife of Dr. H. S. Habibis, a daughter.

McNeill.—On February 26, 1952, at the Simpson Memorial Maternity Pavilion, Edinburgh, to Margaret (formerly Buchanan), wife of Dr. Ronald S. McNeill, 33, Colinton Mains Place, Edinburgh, a son.

Morrison.—On February 22, 1952, at Bankhall Maternity Hospital, Burnley, Lancs, to Dr. Agnes Morrison, wife of Dr. Arthur Blakemore Morrison, a daughter.

Valentine.—On March 3, 1952, to Pamela, wife of Dr. G. H. Valentine, M.R.C.P., D.C.H., of Market Deeping, Lincs, a daughter—Nicola Gay.

MARRIAGES

Carré-Forshaw.—On February 23, 1952, at Weybridge, Surrey, Ivo John Carré, M.B., M.R.C.P., D.C.H., to Pamela June Sutherland Forshaw.

DEATHS

Bassett.—On March 4, 1952, Frank Pickering Bassett, L.R.C.P.&S.Ed., L.R.F.P.S., of St. James Road, Surbiton, Surrey, late of St. Helens, Lancs, aged 89.

Blakely.—On February 24, 1952, at Sheffield, John Blakely, M.B., Ch.B. Browne.—On March 3, 1952, at Wells, Somerset, Ada Margaret Browne, L.S.A., of 25, Denton Road, Wokingham, Berks.

Bullough.—On March 4, 1952, at 57, Hall Lane, Hindley, near Wigan, Fred Bullough, M.B., Ch.B., aged 75.

Dickson.—On March 14, 1952, at his home, 55, The Broadway, Thorpe Bay, Essex, James Dickson, M.C., M.B., Ch.B.

Dodgson.—On March 4, 1952, at Maldwyn, Conway, Caern., Robert William Dodgson, O.B.E., M.D., M.R.C.P., aged 81.

Doorly.—On March 13, 1952, at his home, Arthur Rawdon Carrington Doorly, M.B., B.S., of Surbiton, Surrey.

Jones.—On February 23, 1952, at Llwyn Onn, Holywell, Flint, Arthur Owen Jones, M.R.C.S., L.R.C.P., aged 54.

Jones.—On March 6, 1952, at 41, Shoot-up Hill, London, N.W., Edmund Benjamin Jones, F.R.C.S., L.D.S., aged 83.

Leverton-Spry.—On March 3, 1952, at his home, St. Keverne, Helston, Cornwall, Edward Leverton-Spry, M.R.C.S., L.R.C.P., aged 72.

Mack.—On March 14, 1952, in a flying accident, Edward Wintrip Forsyth Mack, M.R.C.S., L.R.C.P., Squadron Leader, R.A.F.

Martyn.—On March 4, 1952, at Moulton, Lincs, Frank de Récourt Martyn, M.R.C.S., L.R.C.P.

Meredith.—On March 7, 1952, at the Johns Hopkins Hospital, Baltimore, Maryland, U.S.A., Lida Orem Meredith, M.R.C.S., L.R.C.P.

Mills.—On March 7, 1952, at his home, Shrawley, near Worcester, George Percival Mills, M.B., F.R.C.S., aged 68.

Munden.—On March 8, 1952, at Eastcombe, Stroud, Glos, Marwood Minter Munden, M.R.C.S., L.R.C.P.

Orr.—On March 2, 1952, in a nursing-home, Ada Annie Hatchard Orr, M.B., Ch.B., of 2, South Larmouth Avenue, Edinburgh.

Osburn.—On March 7, 1952, at Bournemouth, Arthur Carr Osburn, D.S.O. and Bar, M.R.C.S., L.R.C.P., Lieutenant-Colonel, R.A.M.C., retired, aged 75.

Pearson.—On February 25, 1952, at 40, Portland Road, Leicester, Dudley Garencières Pearson, M.B., B.C.

Pennefather.—On March 15, 1952, Richard Dymoke Pennefather, L.R.C.P. & S.I. & L.M., of Herne Hill and Haywards Heath, latterly of Kentwyns, Horsham, Sussex.

Stirk.—On March 10, 1952, Percy Herbert Stirk, M.R.C.S., L.R.C.P., D.P.H., aged 83.

Stockwell.—On March 9, 1952, at 3, The Grove, Roundhay, Leeds, George Ephraim St. Clair Stockwell, M.B., B.Ch., aged 75.

Thorold.—On March 4, 1952, at 3, Bathwick Hill, Bath, William Grant Thorold, M.R.C.S., L.R.C.P., Major, I.M.S., retired, aged 89.

Trist.—On March 11, 1952, at St. Mary's Hospital, Clifton, John Ronald Rigden Trist, M.C., M.R.C.S., L.R.C.P., of 120, Henleaze Road, Bristol.

Vint.—On March 6, 1952, at his home, Cranethorpe, Strandtown, Belfast, Edward Thomas Vint, M.B., B.Ch., Major, R.A.M.C., retired, aged 85.

Watson.—On March 5, 1952, at 32A, Brunswick Terrace, Hove, Sussex, William Watson, L.R.C.P.&S.Ed., L.R.F.P.S., late of Holbeach, Lincs, and Cambridge, aged 81.

Whyte.—On February 27, 1952, at the Leicester Royal Infirmary, Alexander Whyte, M.B., Ch.B., D.P.H., aged 43.

Young.—On March 5, 1952, at 10, Manchester Road, Bury, Lancs, David Hunter Dow Young, M.B., Ch.B.

Any Questions?

Correspondents should give their names and addresses (not for publication) and include all relevant details in their questions, which should be typed. We publish here a selection of those questions and answers which seem to be of general interest.

When Should a Child be Dry?

Q.—At what age should a child acquire bladder control? Is there anything unusual in a girl of 3 years being still wet both during the day and at night? What steps can the parents take to assist the child? At what age is a full medical investigation warranted?

A.—The average child should have acquired permanent bladder control by the age of 4. There is, however, a very wide range of variation, and it is perfectly normal for a child to have acquired day and night control by the age of 18 months and yet relapse as its interests widen; nevertheless day and night control should again be established during the fourth year. If the girl in question is still being wet day and night at the age of 3 it is essential to know if she has actually been dry for perhaps two hours during the day and ever had one single dry night. If this is so, it is unlikely that there is any organic disease provided the urine is normal. If, however, the child is persistently wet all the time and has never had dry spells, then full investigation should take place at once. Constipation and infestation with worms are common factors, but day wetting at the age of 3 is more often due to carelessness and the distraction of other things. Parents are most likely to succeed in dealing with the problem by regular training in the daytime—that is, sending the child to pass water at gradually increasing intervals, starting with half an hour, so that at no time does she ever experience the urgency to void. When the child manages two-hour intervals by day it is likely that she will start being dry at night. Quite a number of children of this age, however, are wet in the daytime and dry at night simply because they do not bother; in these circumstances parents should not be afraid of disciplining them.

Proctalgia Fugax

Q.—Could you please advise on the aetiology and treatment of the following condition:

The complaint is one of severe and sudden attacks of pain in the rectum at infrequent and irregular intervals. It most frequently occurs at stool, but may occur at any time even during the night, wakening the sufferer. I have known some patients to faint with it. Attacks last from two to five minutes, and, though the whole rectum seems involved, a focal point of severity can often be described as "working its way right round the rectum." The patient is left limp after an attack. Most of the cases have been healthy young adults free from haemorrhoids, constipation, and anal fissure. Both men and women are affected.

A.—It would appear that this is a case of proctalgia fugax. The cause of the condition is unknown, but it is probably due to spasm of the pelvic floor muscles. It often occurs in patients who are anxious or overworked, and it is not uncommon in those who fear the development of a rectal carcinoma.

The writer has had the opportunity of examining a patient during an attack, and he has no doubt that the pain is due to muscle cramp.

Regarding treatment, the patient should be reassured. When an attack occurs it can often be stopped by simple dilatation of the anal canal by the passage of a finger into the rectum. A more severe attack can be terminated very-

quickly by injection of a small quantity of air into the rectum through a rubber catheter, using a Higginson syringe. The patient is advised to keep some finger-stalls and/or a catheter and syringe at the bedside in case he should have a sudden attack. Some patients appear to be relieved by the insertion of an antispasmodic suppository.

Vanishing Creams

Q.—Many proprietary ointments are made up in a vanishing-cream base and are not messy to apply. Can the ordinary skin medicaments be incorporated in a vanishing-cream base? If so, what is the composition of the base? What is Halden's emulsifying base?

A.—Many common medicaments can be incorporated in a vanishing cream type of base such as unguentum emulsificans B.P. (anhydrous) or unguentum emulsificans aquosum B.P. The former preparation is made from emulsifying wax which contains cetostearyl alcohol and sodium lauryl sulphate, and when mixed with water gives an oil-in-water emulsion resembling a vanishing cream. The following compounds are incompatible with this type of base: phenol (above 1%), mercurous chloride, ichthylol, sublimed sulphur, solution of coal tar, acridine antiseptics.

The preparation known as Halden's emulsifying base, described by Mumford (*Brit. J. Derm. Syph.*, 1938, 50, 540), has the following formula: liquid paraffin 3 g., white soft paraffin 2 g., "lanette wax SX" 2 g. A modification by Soulsby (*Brit. J. Derm. Syph.*, 1940, 52, 25) is: liquid paraffin 50 g., white soft paraffin 20 g., "lanette wax SX" 30 g. The addition of 5% of anhydrous wool fat is said to improve these bases. ("Lanette wax SX" is a proprietary preparation which is very similar to the emulsifying wax of the *British Pharmacopoeia*, and the above bases closely resemble the official unguentum emulsificans.)

The following are the main advantages of these oil-in-water emulsifying bases: (a) they are miscible with sweat and serum and do not clog the pores; (b) they are readily washed from the skin and are less liable to soil clothes than the more fatty bases; (c) many antiseptics are more active in this type of base than in purely fatty bases; (d) they are readily absorbed.

For a comprehensive survey of this subject see *Report of a Symposium on New Emulgents and Ointment Bases*, British Pharmaceutical Conference, 1947 (*Quart. J. Pharm.*, 1947, 20, 481).

Albuminuria in Gout

Q.—(1) Does the fact that a gouty subject has albumin in his urine and polyuria contraindicate the use of cinchophen? (2) Would the use of cinchophen, if permissible, get rid of uric acid deposit in the kidneys or lessen the amount of urine and albumin passed? (3) Is there evidence that the newer forms of cinchophen are less liable to damage the liver than cinchophen itself? (4) How does the presence of a moderate amount of albumin in the urine and the polyuria affect the prognosis?

A.—(1) Some albuminuria and polyuria do not contraindicate the use of cinchophen, the drug being much more deleterious to the liver than to the kidneys.

(2) It is unlikely that a large uric acid deposit in the kidneys would be affected by cinchophen, nor would cinchophen lessen the amount of urine or albumin passed.

(3) The evidence that the newer analogues of cinchophen are less deleterious to the liver than cinchophen itself is inadequate.

(4) If the albuminuria and polyuria are expressions of a progressive glomerulonephritis, the prognosis becomes correspondingly more grave. It is aggravated depending on the degree to which renal function has been reduced and the extent of the associated hypertension.

Fertility after Prostatectomy

Q.—Are contraceptives necessary after enucleation of the prostate?

A.—It is the usual practice of most surgeons to divide and doubly ligate both vasa at the time of prostatectomy, and following this procedure the patient would certainly be infertile.

If prostatectomy alone has been done it is not quite so easy to give a dogmatic answer, although it is often stated that the patient is potent but infertile. There are two important factors to be considered. First, incompetence of the internal vesical sphincter results in the semen running into the bladder instead of being ejaculated normally. The semen would then be passed together with the next specimen of urine. Secondly, in the absence of prostatic secretions the spermatozoa might not attain full motility. With regard to the first of these points it should be emphasized that the internal sphincter may not always be incompetent; regarding the second point, it must be remembered that the whole of the prostate has not been removed and that some functioning tissue usually remains. Bearing these facts in mind, it may be said that, while there is thus theoretically a risk that a patient might father a child after prostatectomy, the chances are so remote as to make contraceptive measures unnecessary.

NOTES AND COMMENTS

Acrocyanosis.—Dr. A. W. BAUER (London) writes: Might I make a small addition to your expert's answer about acrocyanosis ("Any Questions?" February 16, p. 396)? Certainly "priscoll," nicotinamide, and hexamethonium should be given a trial, but, as your expert remarks, the effective dose usually produces other circulatory symptoms (and side-effects) which render the drugs useless in practice. Modern developments have provided us with a harmless and excellent weapon to combat peripheral circulatory disorders such as *digit mortui*, acrocyanosis, Raynaud's and Burger's diseases: ultrasonic therapy; and this should definitely be contemplated before embarking on surgical intervention. See Buchtala, Suthliff, Tschannen in the special issue on ultrasonics in the *British Journal of Physical Medicine*, January, 1952. Up to the present I myself have had no failure in eleven cases (one acrocyanosis, three Raynaud's disease, and seven *digit mortui*).

Geographical Tongue.—Dr. DEAN A. SMITH (London) writes: In view of the world-wide circulation of the *British Medical Journal*, may I suggest an addition to your expert's answer on geographical tongue ("Any Questions?" February 23, p. 448)? In many parts of the Tropics and subtropics the commonest cause of geographical tongue is nutritional ill-health. There is much evidence relating the condition to riboflavin deficiency, but it is probable that lack of other factors of the vitamin-B complex, particularly pyridoxin, may contribute. Treatment with a good source of the whole complex, such as yeast, is successful in the great majority of cases.

Dr. A. ROITH (Colchester) writes: In the answer on the causes and treatment of geographical tongue no mention was made of the fact that in children, at least, this condition is invariably due to chronic indigestion, and the condition will gradually clear up as the state of digestion improves with the appropriate treatment.

All communications with regard to editorial business should be addressed to THE EDITOR, BRITISH MEDICAL JOURNAL, B.M.A. HOUSE, TAVISTOCK SQUARE, LONDON, W.C.1. TELEPHONE: EUSTON 4499. TELEGRAMS: *Atitology, Westcent, London*. ORIGINAL ARTICLES AND LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated.

Authors desiring REPRINTS should communicate with the Publishing Manager, B.M.A. House, Tavistock Square, W.C.1, on receipt of proofs. Authors overseas should indicate on MSS, if reprints are required, as proofs are not sent abroad.

ADJUDICATION BEGINS

STATEMENT OF G.M.S. COMMITTEE'S CASE

The adjudication between the General Medical Services Committee of the British Medical Association, representing all general practitioners in the National Health Service, and the Minister of Health and the Secretary of State for Scotland was opened in Chancery Court III before Mr. Justice Danckwerts on Tuesday morning, March 18. The General Medical Services Committee was represented by Mr. F. Grant, Q.C., Mr. H. B. H. Hylton Foster, Q.C., M.P., and Mr. S. B. R. Cooke, instructed by Messrs. Hempsons, solicitors to the Association. The Ministers were represented by the Attorney-General (Sir Lionel Heald, Q.C., M.P.) and Mr. Peard Clarke.

Mr. Justice Danckwerts, on taking his seat, said that he proposed to sit each day from 10 a.m. to 1 p.m., and from 2 p.m. to 4 p.m., and not to sit on Saturdays.

Mr. Grant then proceeded to present the case on behalf of the General Medical Services Committee. After reading the relevant sections of the Act, he said that the determination of the proper amount to be paid into the central pool was, of course, of first importance to general practitioners. It was well known that general practitioners who were giving their services in the N.H.S. were working very long hours, and were probably working a great deal harder than anybody expected when the Service began.

They were working also under conditions of great difficulty and carrying onerous responsibilities, and there was a strong feeling among them that up to now a great deal less than justice had been done to them as regards remuneration.

The Spens Committee in 1946 in its report had stressed the importance of paying adequate remuneration to general

practitioners in a National Health Service, and had given two reasons, among others, why it was important in the public interest that the remuneration of these practitioners should be at a proper level and the status of the profession be maintained. The first reason was that unless this was done an adequate supply of recruits to the profession to work as general practitioners would not be forthcoming, and the second was that if a general practitioner was worried

Sir Lionel Heald, Q.C., M.P.

about financial stringency the help and support he could give to his patients must be seriously affected. Both these reasons still held good.

No New Claim

General practitioners, Mr. Grant continued, were not now making any new claim. All that they were asking was that full and proper effect be given to the recommendations of the Spens Committee. The committee had laid down a certain scale of net income for general practitioners in a National Health Service which it considered fair, reason-

able, and even necessary for the carrying out of their duties. That scale was based on 1939 values, and Spens also recommended that it should be adjusted for later years with direct regard to changes in value of money and to increases in remuneration received by persons in other professions.

His clients—the General Medical Services Committee—were strongly of opinion that full effect had not been given to the recommendations of that Committee, and in particular that the amount in the central pool had never been adequate in any period since the N.H.S. began. The amount to be paid into that pool was a matter to be decided in the present proceedings. He would place before his lordship a formula which, his clients said, provided a good basis for giving effect to the Spens recommendations. The formula would be based upon the year ending March 31, 1951, because, once the formula was fixed and the figures for that year established, it ought not to be difficult in the light of that to work out the figures for the other years.

The Spens Committee Report

Certain matters were agreed. It was agreed that the present adjudicator should deal with all periods from July 5, 1948, onwards. It was agreed that for giving effect to the recommendations of the Spens Committee it was best to treat practice expenses and net income separately. The expenses had to be calculated on some percentage of the gross receipts—a percentage which could, of course, be reviewed from time to time. He proposed to put forward the Committee's formula and to leave his criticism of the formula put forward by the Ministry until he had heard more about it—at the moment he did not quite know what the formula was. The Ministry proposed to bring into its formula two elements—namely, a percentage increase to cover the increase in the population since 1949, and a percentage deduction to cover the fact that a certain proportion of the population did not make use of the Service. There were also certain estimates of practitioners' income from various other sources which appeared in the Ministry's statement, on which more would have to be said. But at the moment he would present his own case.

Mr. Grant then read the relevant paragraphs of the Spens Report and the recommendations. It appeared from para. 6 of the report that the scaling up had to have regard to the change in the value of money and also to the increase in the income in other professions. Effect had to be given to both these factors, and that could only be done by scaling up to whichever of them produced the larger percentage increase. A second general submission was that only the first and second recommendations contained anything in the nature of figures. Further, the report of the Spens Committee and the present adjudication were concerned only with general practitioner remuneration in the N.H.S. Neither the Spens Committee nor the Adjudicator was concerned in any way with those general practitioners who were not in the Service. What Spens did was to lay down a scale of remuneration for the individual general practitioner, and that fact must govern the approach to the present proceedings. The Spens Committee was not recommending a total sum, but a scale of remuneration which the general practitioner ought to receive, and the terms of the reference of the present adjudication were:

"To determine the size of the Central Pool, after taking account of remuneration from all other sources received by general practitioners, in order to give effect to the recommendations of the Spens Committee, having regard to the change in the value of money since 1939, to the increases which have taken place in incomes in other professions, and to all other relevant factors."

Counsel then proceeded to set out the figures in the statement of claim. His presentation of the case occupied almost the whole morning, and he was followed by the reading of the evidence of the first Association witness, Professor G. C. Allen.

The case continued as we went to press. A full report will be given next week.

WARNING TO DURHAM

TIME LIMIT IMPOSED

A letter has been sent to the Durham County Council by the Joint Emergency Committee of the Professions requesting the council to give an undertaking that its professional employees shall not be subjected to the policy of compulsory membership (the "closed shop") "in whatever manner, direct or indirect, it may be applied."

The Joint Emergency Committee "reluctantly finds it necessary to impose some time limit upon further exchanges in this protracted dispute, which has already lasted more than a year." If no satisfactory undertaking has been received by April 30 the Joint Emergency Committee "will be constrained to take further action to protect an essential principle of professional freedom." The Committee will be glad to send a deputation to the council "if the county council should consider that it would serve any useful purpose."

330,000 Professional Workers

The Joint Emergency Committee of the Professions consists of representatives of the following professional organizations: the B.M.A., the British Dental Association, the Engineers' Guild, the National Union of Teachers, the Royal College of Midwives, and the Royal College of Nursing. The number of professional workers represented by the Joint Emergency Committee is about 330,000.

Copies of the letter have been sent to the Ministers of Education, Health, Housing and Local Government, and Transport.

DRUG BILL NOW £50M.

MINISTER AT LINCOLN DIVISION

The Minister of Health, Mr. Harry Crookshank, speaking at the annual dinner of the Lincoln Division of the B.M.A. at Lincoln on March 14, emphasized the need for economy in prescribing. General practitioners, he said, were in a position of great influence here. The most worrying of all the items of expenditure in the National Health Service was the drug bill. It was surely out of all proportion that out of a total expenditure on the whole Service in Great Britain, one-eighth, or over £50m. a year, should be spent on the drugs prescribed by general practitioners and dispensed by chemists. And the most alarming feature of this expenditure was that it had increased steadily every year since the scheme started. The increase had been a double one, an increase both in the numbers of prescriptions prescribed and in the average cost of each prescription: last year the number in England and Wales alone was just on 230 million prescriptions and the estimated average cost over 3s. 8d.

Proposed 1s. on Prescriptions

The drug bill had got out of control, he said, and it was for this reason that the Government proposed a shilling charge on prescriptions. He appreciated that this would involve certain difficulties for certain doctors, especially in rural areas. "The wider question raised by what has happened is whether all this prescribing is really necessary. Most doctors, when speaking generally, seem to say no, but it is much more difficult to apply this maxim to the individual case, where many factors come into play; there may be pressure by the patient, convinced that he cannot get better without a 'bottle,' or high-powered salesmanship by the travelling representatives of the drug manufacturers, or the difficulties to-day experienced by the doctor in ascertaining the cost of prescribing."

The Doctor Knows Best

He said that doctors sometimes asked what the Ministry of Health was doing about these things. "To patients I would say: 'Your doctor knows best what is good for you; do not press him for any particular medicine you may fancy;

pay more attention to what he advises. Surely in the present educated age we should have outgrown the bottle habit. And, anyhow, you really have no right to ask the doctor for remedies intended for self-medication and the doctor is under no obligation to supply such remedies."

Best Protection

The doctors' best protection against high-powered and sometimes over-enthusiastic salesmanship was knowledge of the cost of prescribing, he continued. With the valuable and active help of the B.M.A. the Ministry was producing a short bulletin, to be issued periodically, intended to convey to doctors in a brief and readable form outstanding facts about the cost of prescribing. The first number was now about to be distributed. Everyone wanted the patient to have all remedies necessary to restore him to health and activity in the shortest possible time, but in our present financial difficulties it was a duty on everyone to avoid any expenditure which was not necessary. In this field he hoped to receive the co-operation of the medical profession. "But in expressing such a hope I trust I am not going beyond what it is proper for me to say: in the last resort, it is with you, the doctors, not with me, that the responsibility for looking after your patients rests."

1s. ON PRESCRIPTIONS VISITS TO PARLIAMENT

This week a deputation from the G.M.S. Committee met the Minister of Health to discuss the 1s. on prescriptions. The G.M.S. Committee's view is that 4,000 dispensing doctors should not be made to act as intermediaries for the Inland Revenue.

On March 12 the deputation had met the Conservative Party Social Security and Health Committee to discuss this problem.

See *Journal*, page 665, for statement in Parliament.

NATIONAL INSURANCE CHANGES CLASSIFICATION OF CONSULTANTS

At present consultants and specialists employed for more than half their time by a hospital board are classified as employees for the purposes of national insurance. From March 31 consultants and specialists will also be classified as employees if they are employed for more than half their time in the aggregate by two or more boards. This revision is made by the National Insurance (Classification) Amendment Regulations, 1952. It conforms with the recommendation of the National Insurance Advisory Committee (*Supplement*, November 3, 1951, p. 192).

The committee also recommends a further change. It is that for purposes of classification the employing bodies should not be restricted to the National Health Service. That is, a consultant should be classified as an employee if for more than half his time he works in comparable posts outside the Health Service. Such posts might be in an industrial firm or a hospital outside the N.H.S.

TRAINING GRANTS FOR ASSISTANTS

Training grants will not be paid in respect of assistants liable and medically fit for military service. Executive councils are reminded of this in a circular from the Ministry of Health (E.C.L. 18/52). If in doubt the principal should contact the secretary of the Central Medical War Committee at B.M.A. House, Tavistock Square, London, W.C.1.

Heard at Headquarters

The Plague of Inaudibility

Mr. Beverley Baxter, M.P., who is also a dramatic critic, has been writing in a London paper that "inaudibility is spreading through the London theatres like a plague." In some theatres from the middle of the stalls it is impossible to hear half the dialogue. He suggests that the reason is the tendency of actors—and the same applies to public speakers—to telescope their words and also, unlike the French, to drop the voice at the end of a sentence. If Mr. Baxter attended medical societies he would find the same fault. A generation ago most speakers at medical meetings were careful of enunciation and in their choice of words and phrases. To-day the whisperings and twitterings and mutterings are lamentable. It is the younger men who are most at fault. Could there not be at medical schools at least one lecture in a session on the art of public speaking?

The New Pharmacy

The pharmacists who discussed with the General Medical Services Committee the levy on prescriptions suggested, very nicely and politely, that many doctors in their prescribing are unaware of the cost of drugs, especially of proprietaries. They even suggested that at doctors' meetings there might be staged demonstrations to bring home to them what their prescriptions meant in pence, shillings, and sometimes pounds. Apparently it would not be enough to give the cost in money value, because such a value has very little meaning nowadays, money being an illusory, ghostlike material, more of a symbol than ever, but hardly for two consecutive days a symbol for the same thing. What must be done is to exhibit side by side, for instance, a 4-oz. box of white lint and a packet of cigarettes, and so on up the scale until the most expensive medicaments are put side by side with a television set. On the same occasion there was passed round the following, an authentic request written in pencil on a piece of packing paper:

"Dispenser. The Children have all got coughs, so can I have a Bottle to range from 14 yrs to 10 yrs, the Eldest is Ivor. . . . I know how to give the different doses. Can my Mother and myself have a large Bottle of 'lintus lardins.' Thank you for saving my time coming down. Mrs. M. . . ."

No doubt the compilers of the new *British Pharmacopoeia* will take note.

Mixed Motives

Why do people become doctors? Dr. George Day, in his oration before the Hunterian Society at the Mansion House the other evening, gave three main motives. The first was a somewhat adolescent and vague wish to do good, to make people well and improve their lives. The second was curiosity to find out how the body and mind worked, how the wheels went round, and to probe into illimitable mysteries. The third was self-betterment by becoming a professional man with a motor-car and a recognized social position. He thought every member of the medical profession who went into practice was influenced by all those motives, little or much, but the relative proportions of them differed with every individual. Another remark made by Dr. Day was perhaps more challengeable. He said that he had known many people drift into public health and preventive medicine after therapeutic disillusionment, but hardly any set out from the very beginning with a purely preventive aim. Another interesting passage in the oration concerned predestination to illness. He gave a long list of people, in history and fiction, who might be considered as predisposed to tuberculosis—for example, Hamlet and Richard III—and a similar list of people who were not predisposed—Betsy Trotwood, Mrs. Proudie, Sam Weller (not to go outside nineteenth-century fiction); on the other hand, Job Trotter and Alfred Jingle only escaped it, if they did escape it at all, by a squeak.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

Health Service Charges

SIR,—As a dispensing doctor I gather that the Ministry's latest idea is to deduct 3s. 6d. per annum per patient on my list and allow me to recoup myself on such shillings as I can raise from my patients.

Working on a random sample of 100 patients, the average number of items issued by me in the last twelve months was 1.86 per patient. So that, had this system been in operation, for each patient on my list I could have collected a maximum of 1.86 shillings, and should have had to pay the Ministry 3.5 shillings. Loss on each patient = 1.64 shillings; net financial loss to me on a list of 2,000 = £164 per annum.

To maintain financial equilibrium in the future I shall have to prescribe twice as many drugs as at present. This seems a curious way of economizing.—I am, etc.,

Felstead, Essex.

PETER A. WALFORD.

SIR,—Your report of the General Medical Services Committee (*Supplement*, March 1, p. 77) nearly made me weep. Had the leaders of the profession only shown more determination before July 5, 1948, when the ball was at our feet, we would not now be in the humiliating position of having to go cap in hand to beg for a few more shillings on the capitation fee and of being told that some of our brethren are to act as tax collectors for the Government. The standard of general practice would not now be falling throughout the country, our status and relationship with our patients would not now be at its present low level, there would not now be queues of unemployed doctors after every advertised vacancy, and, in short, the present dreadful scheme would not have been foisted upon the country.

Perhaps we might have built up something really worth while, something, even, on the lines of the Australian national health service, which is such a credit to Sir Earle Page and his fellow countrymen. This would not cost the fantastic millions of the present service, and, encouraging doctors to give of their best, would have raised the standard of medicine even higher in this country. Why has the summary of this scheme been published? Dare one hope that our leaders are casting envious eyes at our Australian cousins and wondering whether after all it may not be too late?—I am, etc.,

East Horsley, Surrey.

BASIL S. GRANT.

Disposal of Doctors' Houses

SIR,—I should like to express my complete agreement with Dr. A. C. E. Breach's admirably lucid letter (*Supplement*, March 8, p. 92) on the problem of the disposal of doctors' houses in general practice. As he says, the difficulty that has arisen is none of our making and was foreseeable. To try to find a solution for the Government, by ourselves adding to restrictions and penalties under which the profession groans, is monstrous and unthinkable. We should stand for the restoration of freedom and not for its further curtailment.

A positive inducement to a doctor to part with his house to a successor, by attaching a premium to the price he would be allowed to ask, might be an acceptable solution. Such attachment, of course, ought to bear some relation to the price which could be obtained in the open market and should not be tied to an arbitrary valuation at 1939 figures.

I hope that the extremely definite expression of opinion by the Conference last November will be borne in mind by the G.M.S. Committee and not relegated to oblivion—a

fate that has not seldom befallen similar expressions of opinion in the past. It is all very well to be prepared to compromise, but for heaven's sake let us not play our opponents' game for them.—I am, etc.,

Wolverhampton.

VICTOR RUSSELL.

Graded Capitation Fees

SIR,—I cannot agree more heartily with Dr. H. Firman (*Supplement*, March 1, p. 84) that a rise in capitation fee is necessary, especially for doctors with small lists who cannot see much prospect of increasing them. I only pointed out that our representatives might have a difficult task in persuading an impartial tribunal.

Whether or not we secure such an increase, there is much to be said for a higher capitation rate for the first 1,500 on all lists, a medium rate for the second 1,500, and a much smaller rate for any above 3,000, which in my opinion is about as many as any doctor can manage comfortably (except in densely populated districts where visiting is restricted to a very limited area). I fervently hope, with Dr. Firman, that our representatives will be successful.—I am, etc.,

Birmingham.

W. WATSON NEWTON.

The School Medical Service

SIR,—Dr. W. G. Hutton's letter (*Supplement*, March 1, p. 82) should awaken interest in our present system of child health care. Many authorities have stressed the need for improved liaison in the services concerned. In order to further this liaison in all areas of the country some change in our present system is indicated, and, as Dr. Hutton states, a single service is preferable to the present double one. It would be difficult to calculate the present wastage, but it seems that this may be considerable.

In my experience any one child can be involved in a series of "services." It is not uncommon for a child attending local-authority clinics to attend a general practitioner and to be sent to a hospital, where it may attend various special departments. It is little wonder that it is difficult to obtain an unbiased history from a mother overwhelmed by the interest shown in her offspring.

On the other hand, it is not impossible to discover a child who has missed all school medical examinations because of frequent absence or moving and who may have attended various general practitioners none of whom have obtained any opinion on the cause of such a child's backwardness or delinquency.

A considerable proportion of the child population attends private schools where there may be no routine medical inspection, and, if any, this may not be conducted by a doctor trained in paediatrics and social medicine.

In spite of the improvement in child health services during the half-century, much of which must be due, as Dr. Hutton states, to the local-authority services, I have reached the conclusion that the general practitioner must be the mainspring in an integrated service. Times have changed, and many of these services were designed for a rather different social structure. If the care of the ill child is taken away from the general practitioner the child loses a valued family friend. It is to be borne in mind that not only the child but its family may need treatment to achieve a desired result. For the general practitioner medicine is still an art and not a pure science even in these days.

There are many doctors who would like to enter general practice in spite of the remuneration, but they see all its interest being removed. Alas, Dr. Hutton suggests the removal of one of its chief appeals.

For an integrated child health service it would be essential to expand the general-practitioner service and to allow direct access to ancillary aids of various sorts. For instance, the practitioner would need to call directly on the services of the local authority, including the health visitors and social workers. A much improved system of obtaining full developmental and genetic histories could be obtained, all children in the population being covered. Children would be examined at regular intervals wherever they might be. Their history form would always be available to whatever doctor was responsible for their health.

A general practitioner not wishing to conduct his own routine inspections could apply to the local authority for this to be

done by their medical officer. Local authorities would hold duplicate records for statistical and research purposes.

It should be possible to assess the amount of time the general practitioners in a given area would be prepared to devote to their child patients and so to gain some idea of the proportion of the amount to be done by the local authority.

At present the local authorities are able to take matters into their own hands and staff their own clinics without approaching general practitioners in the areas concerned. There is bound to be ill feeling between those given a fixed daily service with no direct responsibility to the patient and those working a twenty-four-hour service and holding responsibility for the patient. Parents know this, and some are resentful of the school medical examinations, referring to "our own doctor" and so on, thereby making the examination a farce and being very likely to ignore any advice given.

Distraught mothers fly from one source of advice to another, obtaining various formulae for feeding a yelling baby. It must be the doctor who will visit the baby in the middle of the night who has the last word.

General practitioners and hospital officers may have scanty knowledge of the field work done by the local-authority medical officer, as this is specialized work requiring special qualification, though not employing younger graduates for training as most other specialties. Facilities for further study in the local-authority services might be made for trainee assistants.

It would seem that definite evidence of the need for an improved child health service could be obtained if those concerned with this subject thought fit. It might be possible to form groups composed of paediatricians, child-guidance and mental-deficiency representatives, local-authority medical officers, and general practitioners, to cover B.M.A. group areas. Dental and ancillary services could be represented.

To summarize, it has been noted that improved liaison in the child health services is necessary. The importance of the general practitioner is noted. A suggestion to discover the actual wastage of the present system is made.—I am, etc.,

Winchester.

MYRTLE M. HUTCHINS.

Unsatisfactory Aspects

SIR,—After a series of junior hospital appointments I undertook a few weeks as locumtenent in general practice to see how I liked it. Although some of the work was rewarding, I found certain unsatisfactory aspects.

Minor conditions like coughs, colds, digestive upsets, fibrositis, and so on bring a certain type of patient to the surgery asking for medicine. The honest thing would be to reassure them and send them away empty-handed, thus saving unnecessary expense to the National Health Service. Many of these patients would then go to another doctor who would give them medicine anyway. One's tendency, therefore, is to prescribe unnecessary and useless mixtures in order not to lose the patient.

Another difficulty is the impossibility of examining one's patient completely. Owing to lack of time, one tends to make a snap diagnosis on the history and general appearance of the patient. I found this worrying at first, but there seems no alternative in a large general practice. It must in the end lead to the atrophy of one's clinical acumen and of one's instinct to obtain all the facts of a case before making up one's mind.—I am, etc.,

Caterham, Surrey.

A. J. HEBER.

The Petrol Tax

SIR,—Each spring the Chancellor of the Exchequer produces a budget which modifies the taxation by giving some reliefs and some increased burdens. It is particularly unfortunate for the rural practitioner that the reliefs granted to him are minimal, but the increases affect him more seriously than they do the general public as a whole or even other members of the medical profession.

This year the small relief in one's income tax is offset by (1) a reduced food subsidy, (2) increased insurance contributions, (3) increased telephone charges, (4) increased car tax, and, lastly and most seriously of all, (5) the increase of 7½d. a gallon on the petrol tax. This is the third recent increase in the petrol tax and represents a most grievous additional

burden to the rural practitioner in view of his annual mileage, which may easily reach 15,000 miles per annum, as in my own case.

Despite the tremendous increase in the cost of running a car, there has only been one slight increase in the mileage allowance, and that was largely illusory. When the increase was granted the mileage units claimed by rural practitioners were automatically doubled. Unfortunately this did not mean a doubling of their mileage allowance, because at the same time each unit, in this area at any rate, was reduced in value from 7d. and a fraction to 4d. and a fraction, and the net increase was in the neighbourhood of 40% only.

The day after the budget the Road Haulage Associations and the bus companies were protesting vigorously against the increased charges, which they say will have to be passed on to their customers. How lucky they are. The imposition falls upon the rural practitioner's own pocket and must be borne by him and him alone, as he has no means of passing it on to his patients. Nevertheless one looked in vain for any protest from the B.M.A.

I have always understood that the mileage allowance fulfilled three objects: (1) to cover the cost of running one's vehicle, (2) to allow for the depreciation in its capital value, and (3) to compensate to a small extent for the time lost in travelling. At the present moment the mileage allowance does not even cover the running expenses let alone compensate either for depreciation or for loss of time in travelling.

Few rural practitioners have more than 1,500 to 2,000 patients and easily cover 15,000 miles per annum in visiting them. In so doing they work as hard as or harder than those doctors practising in the towns with 3,000 to 3,500 patients and covering an average distance of 3,000 to 4,000 miles annually. Not only are their earnings very much smaller but their expenses are considerably greater, and they lose both ways. Only by a complete reassessment of mileage allowance can this disproportion in income be ironed out.

It is only by an increase of the mileage allowance that the rural practitioner will be enabled to earn a net income comparable to his town colleague's for the same amount of effort and to be compensated for his greatly increased expenses. At the present moment the rural practitioner is the "poor relation" of the profession, and now is the right and probably the last opportunity of raising him to an equal level with his colleagues.—I am, etc.,

Rye, Sussex.

H. MANNINGTON.

POINTS FROM LETTERS

Sale of Goodwill

Dr. W. C. COLVILLE (Rowrah, Nr. Workington) writes: May I have a word to my fellow convicts via your columns? Dear fellow G.P.s, are you aware that you are serving a life sentence in your present practice? Do you know you have as much chance of a change as a convict has to escape? The sooner the buying and selling of practices is reintroduced the better. I am surprised a so-called intelligent professional body of men tolerates such intolerable conditions. Get us back our freedom.

Anxious

Dr. G. M. ADDISON (Westgate-on-Sea, Kent) writes: An anxious and mystified parent brought her daughter to see me to-day, the school report having stated: "Her diphthongs need attention."

H.M. Forces Appointments

REGULAR ARMY RESERVE OF OFFICERS

Brigadier A. E. Richmond, C.B.E., late R.A.M.C., having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers.

Colonels A. R. Ross and W. W. S. Sharpe, late R.A.M.C., having attained the age limit of liability to recall, have ceased to belong to the Reserve of Officers.

REGULAR ARMY: EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

Captain (War Substantive Major) D. C. MacDonald, M.C., has relinquished his commission and has been granted the honorary rank of Lieutenant-Colonel.

Lieutenants (War Substantive Captains) B. V. Hassan, J. M. Brown, J. L. Dimond, E. S. Bompas, and J. J. W. Evans have

relinquished their commissions and have been granted the honorary rank of Major.

ROYAL AIR FORCE

Air Commodores A. Briscoe, C.B.E., and C. T. O'Neill, O.B.E., have retired.
Group Captain J. Parry-Evans has retired at his own request.
Wing Commander N. I. Smith has retired at his own request.
Squadron Leader D. G. Jarman has reverted to the Reserve.
Flight Lieutenant F. H. D. Hutter to be Squadron Leader.

The National Insurance Advisory Committee in a report to the Minister of National Insurance, Mr. Osbert Peake, recommend that the time limit for an individual claim to death grant and maternity attendance allowance should be extended from one month to three months. They also recommend that a month after ceasing work should be allowed for giving notice of retirement. No change is suggested for the present time limits for claiming sickness and unemployment benefits.

BUCKINGHAMSHIRE DIVISION.—At Bull's Head Hotel, Aylesbury, Friday, March 28, 4 p.m., annual general meeting.

CITY DIVISION.—At Finsbury Health Centre, Pine Street, London, E.C., Tuesday, March 25, 8.30 p.m., Mr. N. C. Lake: "Foot Troubles in General Practice."

DONCASTER DIVISION.—At Messrs. Parkinson's Café, High Street, Doncaster, Tuesday, March 25, 7.30 p.m., joint meeting with Doncaster Medical Society. Dinner, followed by address by His Honour Judge Caporn: "Some Idle Thoughts by One on the Shelf."

DORSET DIVISION.—At the King's Arms Hotel, Dorchester, Thursday, March 27, 8.30 p.m., Annual B.M.A. Lecture by Dr. J. D. N. Nabarro: "Potassium Metabolism in Clinical Medicine."

FURNESS DIVISION.—(1) At North Lonsdale Hospital, Tuesday, March 25, 8 p.m., meeting of Barrow and Furness Clinical Society. (2) At Duke of Edinburgh Hotel, Abbey Road, Barrow-in-Furness, Friday, March 28, 7 for 7.30 p.m., annual dinner.

GREENWICH AND DEPTFORD DIVISION.—At Greenwich Town Hall, London, S.E., Thursday, March 27, 7 for 7.30 p.m., to 1 a.m., dinner and dance.

MONMOUTHSHIRE DIVISION.—At St Mellons County Club, Thursday, March 27, 7.45 for 8.15 p.m., dinner meeting. Address by His Honour Judge O. T. Temple-Morris, Q.C.: "Bits and Pieces."

NORTH-EAST ESSEX DIVISION.—At 14, Popes Lane, Colchester, Wednesday, March 26, 8.45 p.m., annual general meeting.

NORTH WALES BRANCH.—At Ruthin Castle, North Wales, Wednesday, March 26, 3 p.m., spring meeting. Four short papers.—Mr. H. Morriston Davies: "Bronchiectasis"; Dr. J. R. Forbes: "Experiences with A.C.T.H. and Cortisone"; Dr. Gwyn Griffith: "Headache in Infancy and Childhood"; Dr. H. V. Williams: "Syphilis, the Present Position." A discussion will follow.

OXFORD DIVISION.—At Radcliffe Infirmary, Oxford, Wednesday, March 26, 8.15 p.m., meeting. Dr. Raymond Greene: "Vulgar Errors in Endocrinology."

SHEFFIELD DIVISION.—At University Medical Library, Sheffield, Tuesday, March 25, 8.30 p.m., annual general meeting.

SWINDON DIVISION.—At Goddard Arms Hotel, Swindon, Tuesday, March 25, 8.30 p.m., annual general meeting.

TOWER HAMLETS DIVISION.—At St. Andrew's Hospital, Devons. Road, Bow, London, E., Friday, March 28, 3 p.m., clinical meeting.

WEMBLEY DIVISION.—At Wembley Hospital, Tuesday, March 25, 9 p.m., talk by Dr. T. M. Pollock: "Some Aspects of B.C.G. Vaccination."

WIGAN DIVISION.—At The Hollies, Wigan Lane, Wigan, Thursday, March 27, 8.15 p.m., clinical meeting. Films: "Some Aspects of Accessible Cancers" (Skin, Lip, Tongue, Mouth).

WINCHESTER DIVISION.—At Royal Hotel, Winchester, Wednesday, March 26, 8.45 p.m., meeting; 9 p.m., lecture by Dr. Graham Hayward: "Breathlessness."

Meetings of Branches and Divisions

SOUTH STAFFORDSHIRE DIVISION

A meeting of the South Staffordshire Division was held on February 5 at Wolverhampton. Mr. H. Campbell Orr was in the chair, and 42 members were present.

After supper 15 additional members came in to hear a lecture entitled "The Significance of Subarachnoid Haemorrhage and its Surgical Treatment," by Professor Brodie Hughes. Professor Brodie Hughes said that subarachnoid haemorrhage was a symptom, and in all cases the underlying cause should be discovered. The causes (apart from injury) were cerebral aneurysms, cerebral angioma, and high blood pressure in decreasing order of frequency. With slides showing excellent angiograms he illustrated the different types and positions of cerebral aneurysms, and angiomas, and discussed their surgical treatment. After the lecture there was a discussion. Dr. Sheldon and Mr. Patrick then proposed and seconded a hearty vote of thanks to the lecturer. This was carried with acclamation.

THE CHANGING SCENE

With the repository use of penicillin a new conception in penicillin therapy is rapidly gaining favour. Earlier methods of frequent injections are now giving place to the newer technique of a single daily dose.

With 'DURACILLIN A.S.'*—an aqueous suspension of procaine penicillin G—the antibiotic is slowly released into the tissues and a dose of 1 c.c. every 24 hours provides adequate therapy for most infections. 'DURACILLIN A.S.' also possesses other important advantages—it is relatively free from potential allergens, less pressure is required on injection than with oily suspensions and injection is practically painless. As it is ready to inject and remains stable for 12 months, 'DURACILLIN A.S.' is the ideal penicillin preparation for the busy practitioner.

*Registered trade mark.

Support without Constriction . . .

LINIA BELT

designed under medical supervision to correct

FAULTY POSTURE and ENTEROPTOSIS.

Invaluable, too, for POST-OPERATION WEAR.

Arrow No. 1. Shows how the Linia Belt action parts that are usually protuberant, in harmony with the over-all pressure.

Arrow No. 2. Shows how the Linia Belt lifts and holds in place the lower-abdominal parts that have sagged and dilated.

Arrow No. 3. Shows uplifting support on the groin, a protection against rupture and strain.

It avoids the danger of exercising direct restricting pressure on the abdomen. Besides affording support and restoring displaced organs to their correct position, the Linia Belt exerts a gentle massaging action, at the same time bracing the muscles. It is invaluable too, for post-operation wear, and to prevent strain when older men, unused to violent physical effort, take exercise.

B.O.C

UNIVERSAL PORTABLE STAND

for use with GILLIES, BOYLE or other anæsthetic equipment

Designed to meet the exacting requirements of modern surgery, this B.O.C. portable anæsthetic stand (six cylinder model) is superbly built and finished, and smoothly mobile on silent ball-bearing castors. The low centre of gravity makes it extremely stable. Notable protection features include non-interchangeable couplings, with quick coupling of cylinders on the open yoke principle, and colour identification to B.S.I. recommendations. Accommodation is provided for two oxygen cylinders, two nitrous oxide, one cyclopropane, and one carbon dioxide—with each cylinder connected and standing by for immediate use. The stand will carry either Gillies, Boyle, or other anæsthetic equipment. Further details will gladly be supplied on request.

The case of the exacting surgeon

A famous surgeon was struck by the fact that his razor blades seemed to be much sharper and more uniform than any scalpels he could then obtain. To a keen and vigorous mind there seemed no reason why the makers of the blades should not make surgical blades of the same high quality.

The solution was indeed brilliantly simple. He asked Gillette to produce surgical blades with edges equal to those of their razor blades. Now the sharpest edge in the world is available to make surgery easier, safer, and more accurate.

Gillette Surgical Blades and Handles are precision-made for each other. Not only does this ensure absolute rigidity in use, it makes the fixing and release of a blade the work of a moment.

Available throughout the world from leading distributors.

Gillette Industries Limited, Great West Road, Isleworth, Middlesex

SURGICAL BLADES OF GILLETTE SHARPNESS

Tonic Therapy

pro infants

COMBINING vitamins A & D with ferric pyrophosphate and glycerophosphates of manganese, sodium and potassium, GLUCOVITE has long been a firm favourite with doctors who have experienced its high acceptability and therapeutic effectiveness.

Its delicious flavour and attractive appearance are universally popular with children (and, it might not be out of place to say, with adults too!).

Co-operation is quickly established between young patient and doctor when GLUCOVITE is the tonic prescribed. Adherence to the dosage timetable, so important in tonic therapy, thus presents no problem.

Clinical samples and literature, gladly, on request.

A unique development in **first aid dressings**

DALMAS WATERPROOF DRESSINGS ACCELERATE HEALING

DALMAS first aid dressings are unlike many others in now being impregnated with 5-aminoacridine hydrochloride, recognized by the medical profession as an effective, non-irritant antiseptic which accelerates healing. Despite the advent of the sulphonamides and penicillin, it holds a definite place in wound-therapy, having a bactericidal action against *B. Proteus* and other Gram-negative organisms.

Dalmas dressings are waterproof, grease-proof, can be worn while washing, and are themselves washable. They stretch in every direction yet the edges stick tight. They are skin-coloured, hardly show, and the edges cannot fray.

★ **NOTE:** They should be applied to dry skin.

DALMAS LTD
LEICESTER

OTHER DALMAS PRODUCTS FOR SURGERY OR HOSPITAL

Dalmas Special Doctor's Cabinet. This enamelled metal cabinet contains 180 first aid dressings in seven sizes and shapes with a spool of Dalmas strapping. Price 16/8, refills 14/10. It is invaluable both in the doctor's consulting room and the home.

Dalmas Strapping. A new waterproof adhesive tape in 1-yd. spools (1 inch wide). Retail price 1/-. Also in 3-yd. lengths and in 2-inch and 3-inch widths. Dalmas strapping is ideal for places where a bandage would be awkward or difficult to keep in position.

Dalmas Vaccination Dressings. A new waterproof vaccination dressing, available in two sizes, the smaller being specially for babies and small children. Retail price 1/- for carton of two dressings, or, in the children's size, 1/- for four dressings.

These products are obtainable direct from Dalmas Limited, Leicester, or through your usual supplier.

Laxatives for Children

To aid the Physician in choosing a laxative for children, we give the chief characteristics of Andrews. The dosage is easily adjusted according to age. Andrews is pleasant tasting, and children accept it readily. Its laxative action is mild, and is due to the presence of magnesium sulphate and other salts in balanced proportion which increase the fluid content of the bowel by osmotic action and so lead to easy non-

gripping evacuation. Andrews has a soothing effect on the stomach, stimulates the bile-flow and generally aids digestive processes. It is also useful as a gastric sedative in bilious attacks. Andrews has no costive reaction when discontinued.

Active constituents:

Tartaric Acid	24.600%
Sodium Bicarbonate	25.142%
Magnesium Sulphate (B.P.C. Exsicc.)	19.000%
Sugar	31.250%
Saccharin	0.008%

FLAT FEET —

The 'Inneraze' principle of the in-built wedge

'Inneraze' shoes are supplied (on medical prescription only) for the treatment of pronation. They make use of the wedge principle, but this is applied in a far more satisfactory way than normally. For the wedge is built into the shoe internally, not applied externally.

This, in conjunction with the buttressed heel, ensures that the 'lift' given by the wedge is not altered by wear—not even by repair work. Thus the surgeon is relieved of the need for supervision. The wedge is of course invisible from outside the shoe, which was designed in the closest collaboration with an eminent orthopaedic surgeon. An Inneraze shoe looks almost exactly like any other of the first-class shoes made by Start-Rite for children.

Publishing Manager B.M.A. House
Tavistock Square London W.C.1

FOR EIGHT YEARS a number of experts have each week constituted a Brains Trust for answering questions sent to the *British Medical Journal* from all over the world.

"ANY QUESTIONS?" is a current guide to the practice of medicine. Many of the authoritative answers given supply practical information not yet in the textbooks.

THE BEST of "Any Questions?" is now offered in book form. Please reserve your copy as the edition is limited. The book is bound in cloth, fully indexed, small enough to fit the pocket, and quite indispensable to the General Practitioner in his daily work (pp. 268).

APPOINTMENTS

Applicants should state name, address, age, nationality, qualifications, and enclose 3 copies (unless otherwise specified) of recent★ testimonials with short statement of experience and appointments held.

Applications should be sent at once if no closing date is given.

Canvassing in any form will disqualify.

★SERVICE MEMBERS may have difficulty in supplying recent testimonials, but this should not deter them from applying.

Deferment of call-up for "R" practitioners (i.e., practitioners liable for call-up under the National Service Acts) is granted at the discretion of the Central Medical War Committee and (in Scotland) the Scottish Central Medical War Committee. The Committees normally allow an "R" practitioner to hold a First House Officer post (N.H.S. salary £350 per annum) provided that he obtains it without delay. Under present arrangements the Committees also normally allow an "R" practitioner to hold a Second House Officer post (£400) and a Senior House Officer post (£670), provided in each case that the higher appointment is secured before the termination of the practitioner's current appointment.

"R" practitioners may not accept Third House Officer posts (£450 per annum) unless they have obtained the special permission of the C.M.W.C. or (in Scotland) the Scottish C.M.W.C.

SALARY SCALES OF JUNIOR GRADES OF HOSPITAL MEDICAL STAFF

Registrar Grades, Whole-time

(a) **REGISTRAR**: Posts obtained normally not less than two years after registration as a medical or dental practitioner and held normally for two years: £775 per annum in the first year; £890 per annum in the second and any subsequent years.

(b) **SENIOR REGISTRAR**: Posts obtained normally not less than four years after registration as a medical or dental practitioner and held normally for three years: £1,000 per annum in the first year; £1,100 per annum in the second year; £1,200 per annum in the third year; £1,300 per annum in any subsequent years.

Other Grades, Whole-time

(a) **HOUSE OFFICER**: £350 per annum for the first post held, £400 per annum for the second post held; £450 per annum for the third and any subsequent post held; with, in each case, a deduction at the rate of £100 per annum in respect of board and lodging and other services provided. Each post shall be tenable for six months.

The Minister will be prepared to authorize, in exceptional circumstances, salaries up to £50 per annum higher than the standard rates specified above where a post cannot be filled otherwise.

(b) **SENIOR HOUSE OFFICER**: Posts obtained normally not less than one year (in Scotland, two years) after registration as a medical or dental practitioner and normally held for one year only: £670 per annum.

(c) **JUNIOR HOSPITAL MEDICAL OFFICER**: Officers who have held house appointments but who are not Registrars and who have less responsibility than other hospital officers of non-consultant status: £700 (for an officer appointed not less than two years after registration as a medical practitioner) by £50 to £1,000 per annum.

ALL NATIONAL HEALTH SERVICE HOSPITAL APPOINTMENTS ARE IN ACCORDANCE WITH THE TERMS AND CONDITIONS OF SERVICE OF HOSPITAL MEDICAL STAFF

Those intending to apply for resident appointments in the Registrar grades are recommended to make inquiries with regard to the deductions proposed for board and lodging at the time of submitting their applications, where this is not stated in the advertisement.

OFFICER

In the Blood Transfusion Service in the South-West and South-East Metropolitan Regions. Main duties will be concerned with the collection of blood from donors in the area covered by the South-West and South-East Metropolitan Regional Hospital Boards, but the appointment also offers scope in haematology and serology, including research, at the South London Blood Transfusion Centre, Stanley Road, Sutton, Surrey. Salary scale £700 by £50 to £1,000 per annum. Applications (five copies), stating date of birth, qualifications, experience and present appointment(s), and giving the names and addresses of three referees, should be made by letter and sent to the Secretary (S.D.1), South-West Metropolitan Regional Hospital Board, 11a, Portland Place London, W.1, to arrive not later than April 5, 1952. Applicants may visit the Blood Transfusion Centre by local arrangement. (9721)

CARDIOLOGY**WIRRAL, CALDY MANOR HOSPITAL, Caldy**

(41 beds)

North Wirral Hospital Management Committee

Applications are invited from registered medical

practitioners, male or female, for appointment of

RESIDENT HOUSE PHYSICIAN

for the above new hospital, which specializes in the treatment of heart cases. The appointment will become vacant on April 1, 1952, and will be tenable for six months. Salary in accordance with the approved scales, viz., first post held £350 per annum, second post held £400 per annum, and £450 per annum for the third and any subsequent post held. A deduction at the rate of £100 per annum will be made in respect of board, lodging, and other services provided. Applications, stating age, nationality, qualifications and details of experience, with names of three referees, should be sent immediately to the Secretary, North Wirral H.M.C., Lensowe Children's Hospital, Moreton, Wirral, Cheshire. (8832)

CHEST AND TUBERCULOSIS**LEEDS REGIONAL HOSPITAL BOARD**

Applications are invited for the appointment of a

CONSULTANT CHEST PHYSICIAN (Whole-time)

at the Bradford Chest Clinic. Applicants should possess high medical qualifications and extensive experience of pulmonary tuberculosis and other diseases of the chest. The successful applicant will be the senior member of a team consisting of two Assistant Chest Physicians of Senior Hospital Medical Officer status and a Registrar. There is close collaboration with the Thoracic Surgical Unit at the Bradford Royal Infirmary, and a new chest clinic is nearing completion in the grounds of St. Luke's Hospital, Bradford. The person appointed will be responsible for the administration of a Sub-Regional Tuberculosis Admission Bureau serving the western half of the Region, and for the supervision of the Mass Radiography Unit based upon the Bradford Clinic. He will also be responsible to the Local Health Authority through the Medical Officer of Health for functions relating to the prevention, care and after-care of tuberculosis under Section 28 of the National Health Service Act. Applications, stating age, qualifications, and details of present and previous appointments (with dates), together with the names of three referees, should be forwarded to the Secretary, Park Parade, Harrogate, not later than April 12, 1952. (9990)

NORTH-WEST METROPOLITAN REGIONAL

HOSPITAL BOARD

CONSULTANT THORACIC SURGEON

(Whole-time or maximum sessions)

The consultant appointed will be based at Clare Hall Hospital, South Mimms, Barnet, Herts, but duties will include visits to Colindale Hospital, N.W.9, and associated general hospitals and clinics, including those in Bedfordshire. Applications, with names of three referees to Secretary, North-West Metropolitan Regional Hospital Board, 11a, Portland Place, W.1, by April 19, 1952. Hospitals may be visited by direct appointment. (9593)

BOURNEMOUTH AREA

South-West Metropolitan Regional Hospital Board

Applications are invited for the appointment of

Whole-time ASSISTANT CHEST PHYSICIAN

(S.H.M.O. scale)

to work under the supervision of the Consultant Chest Physician. The successful candidate will be required also to devote two sessions per week to work at the Mass Miniature Radiography Unit, under the Unit Director. Apart from these duties the appointment will be a joint one between the Regional Board and the County Borough of Bournemouth. Applications (five copies), stating date of birth, qualifications, experience and present appointment(s), and giving the names and addresses of three referees, should be made by letter and sent to the Secretary (S.D.1), South-West Metropolitan Regional Hospital Board, 11a, Portland Place, London, W.1, to arrive not later than April 5, 1952. Applicants may visit the area by local arrangement. (9722)

The Board will not undertake to incur any expense in bringing any appointees to North Queensland, Australia. (9263)

TOWNSVILLE GENERAL HOSPITAL**Applications are invited for the position of****PART-TIME PHYSICIAN**

Appointee will be required to conduct four sessions of three hours each week, which includes one session during which the applicant is required to act as Supervising Officer of tuberculosis cases. Salary at the rate of £270 per annum per session of three hours. Private practice is allowed. Applications should be addressed to the Secretary, Townsville Hospitals Board, Townsville, North Queensland, Australia. Applicants should state age, whether married or single, and set out full details of qualifications and experience. The Board will not undertake to incur any expense in bringing any appointees to North Queensland, Australia. (9264)

UNIVERSITY COLLEGE HOSPITAL OF THE**WEST INDIES, JAMAILA, B.W.I.**

Applications are invited for two vacancies for **REGISTRARS** (one Surgeon, one Anaesthetist). Duties to commence on June 1, 1952. The appointments will be for one year in the first instance. Salary will be in the scale of £700 to £1,000 per annum, depending on experience and qualifications, and is subject to a deduction of £100 per annum in respect of board, residence, etc. Return first-class passages by sea will be paid. Further information may be obtained from the Hospital Manager and Secretary. Applications, with full details and two recent testimonials, should reach the Hospital Manager and Secretary, University College Hospital of the West Indies, Mona, Jamaica, B.W.I., before April 30, 1952. (9817)

HER MAJESTY'S COLONIAL SERVICE,**Barbados**

Medical Officers required for general duties (medical and surgical, obstetrics, theatre, ward work, out-patients, casualty, etc.) in Barbados General Hospital (336 beds). Appointment will be on agreement for three years, renewable if desired. Salary scale ranges from \$3,600 to \$4,800 (£750 to £1,000) per annum. (One Barbados dollar equals 4s. 2d.) A cost-of-living allowance at varying rates is payable, subject to a maximum of \$156 (£65) per annum. Free quarters are provided, or an allowance in lieu is payable at the rate of 10 per cent of salary. Passages are provided in both directions for officer, wife and children, up to a maximum of \$1,440 (£300) each way. Generous home leave is granted. Income tax at low rates. Social and recreational amenities are good. Candidates should possess medical qualifications registrable in the United Kingdom. Application forms can be obtained from the Director of Recruitment, Colonial Service, Sanctuary Buildings, Great Smith Street, London, S.W.1 (quoting reference No. 27215/281/52). (9910)

HER MAJESTY'S COLONIAL SERVICE,**British Guiana**

Radiologist required for the Medical Department, British Guiana, to perform general work of Radiologist and to supervise and control X-Ray Department in the Public Hospital at Georgetown. He may be required to visit and supervise the working of X-Ray units in other hospitals, and to perform some other medical duties as the Director of Medical Services may request. Appointment can be made on a permanent basis with pension (non-contributory) at the age of 55, or on short-term agreement for three years in the first instance. Doctors in the National Health Service may resign from the National Health Service but retain their superannuation rights during their time in British Guiana (up to six years), and receive a resettlement grant of 20 per cent of the aggregate of their British Guiana salary on leaving British Guiana at the end of their engagements. Salary scale ranges from £1,000 to £1,200 per annum. Pension is earned at the rate of 1/600th of the final pensionable emoluments for each completed month of service. Income tax at local rates. Quarters are not provided, but a house allowance of £100 per annum is payable. Local leave is permissible, and generous home leave is granted after each tour of two to three years. On appointment free passages are provided for officer, wife and children under 18 years, not exceeding five persons in all. Free passages on leave are provided for the officer only. Candidates must possess medical qualifications registrable in the United Kingdom: have obtained a Diploma in Medical Radiology, and have had not less than two years' experience of radiological work. Application forms can be obtained from the Director of Recruitment, Colonial Service, Sanctuary Buildings, Great Smith Street, London, S.W.1 (quoting reference No. 27215/346/52). (9911)

HER MAJESTY'S COLONIAL SERVICE,**Tanganyika**

Medical Officers are required for general medical duties in Tanganyika. Appointments can be made on a permanent basis with pension (non-contributory) at the age of 45 to 55 or on short-term contracts with gratuity on satisfactory completion of service. Candidates in the National Health Service may resign from the National Health Service but retain their superannuation rights during their time in Tanganyika (up to six years), and receive a resettlement grant of 20 per cent of the aggregate of their Tanganyika salary on leaving Tanganyika at the end of their engagements. Salary scale ranges from £865 to £1,590 per annum. A temporary allowance at the rate of 20 per cent

of salary is also payable, subject to a maximum of £200 per annum. Starting salary will be determined according to age, qualifications, and experience. Special increments are given for approved higher qualifications. Quarters provided at low rental. Free passages provided in both directions for officer, wife, and children up to the cost of three adult fares. Income tax at local rates. Tour of service is from 24 to 36 months. Local leave is permissible, and generous home leave is granted. Education facilities up to higher school certificate are available in East Africa. Social and recreational amenities are good. Candidates must possess medical qualifications registrable in the United Kingdom, and, in addition to the performance of general medical duty (including, in most instances, personal control of a hospital and responsibility for the public health of a district), must be prepared to go on tour and to train subordinate African medical and health staff. Medical officers in Tanganyika are eligible for promotion to administrative super-scale posts, and also, on acquiring specialist qualifications and experience, for numerous specialist appointments in their own or other territories. Application forms can be obtained from the Director of Recruitment (Colonial Service), Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1 (quoting reference No. 27215/149). (9912)

HER MAJESTY'S COLONIAL SERVICE, Malaya

Doctors having medical qualifications registrable by the General Medical Council in the United Kingdom with one or more years' experience after qualification are required for appointment as

MEDICAL OFFICERS AND MEDICAL OFFICERS OF HEALTH

for General Medical and Health duties. Appointment is available (a) on probation for permanent establishment; (b) on employment from the National Health Service; and (c) on short-term contract with gratuity. (a) Permanent terms. Subject to three years' probation, appointment is permanent with pension (non-contributory) at age 55. Salary is paid in the scale £952 by £42 to £1,204 to £1,274 by £42 to £1,652 per annum. There are many posts specialist and administrative, available on promotion carrying higher salaries (up to about £2,400 for the highest post). Promotion is often made before reaching the top (£1,652) of the long scale. There is also a cost-of-living allowance at varying rates, according to family circumstances, subject to maximum of £336 per annum for single men and of £707 per annum for married men with children (both rates higher when stationed in Singapore). Note. Doctors with more than one year's approved experience after age 25 (including service in Her Majesty's Forces) enter the salary scale at points above the minimum according to their experience; and four increments of salary are also given to holders of approved higher qualifications (e.g., F.R.C.S., M.R.C.P., D.P.M., D.A., etc.). (b) National Health Service. Doctors may resign from the National Health Service but retain their superannuation rights during their time in Malaya (up to six years) and receive a resettlement grant of 20 per cent of the aggregate of their Malaya salary on leaving Malaya at the end of their engagements. Emoluments as under (a), including incremental credit for experience and higher qualifications as in note under (a). Doctors so appointed may be considered for permanent terms at any time during their colonial employment provided they surrender their rights to the resettlement grant and payment by Malayan Governments of superannuation contributions. (c) Contract terms. The contract will be for three years' resident service renewable for a further tour of three years by mutual agreement. Salary and cost-of-living allowance as under (a), including incremental credit for experience and higher qualifications as in note under (a). In addition a gratuity earned at the rate of £300 to £450 per annum, according to salary, is paid on expiry of contract. Doctors on contract may be considered for appointment to the permanent establishment at any time on their agreeing to surrender their gratuity earning rights. In all three types of appointment the rates of salary and gratuity refer to doctors eligible for expatriate terms under Malayan Regulations (i.e., those whose permanent homes are in the United Kingdom, Ireland, Australia, Canada, etc.). A limited number of practitioners liable for call up under the National Service Act, 1948, may apply, and if appointed will be granted indefinite deferment of call up on completion of a minimum period of one tour of three years in the Malayan Medical Service. The climate is, for the tropics, healthy. European children do well up to the age of about six and schools are available locally. Income tax is payable at Malayan rates, which are lower than those in the United Kingdom. Government quarters with heavy furniture are provided at a low rental, or an allowance is paid in lieu of quarters. Free passages are provided for the doctor, his wife, and children under the age of ten (not exceeding four persons besides himself) on appointment and once each way during each tour of duty of three to four years. Generous home leave is granted and local leave is permissible. The social and recreational facilities in Malaya are good. Application forms can be obtained from the Director of Recruitment (Colonial Service), Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1 (quoting reference No. 27215/242/51). (5187)

Overseas—contd.

HER MAJESTY'S COLONIAL SERVICE, Kenya
 Medical Officers are required for general medical duties in Kenya. Appointments can be made on a permanent basis with pension (non-contributory) at the age of 55, or on short-term contract with gratuity on satisfactory completion of service. Salary scale is from £865 to £1,590 per annum. Starting point in this scale is determined by the candidate's age, experience and war service. A temporary cost-of-living allowance at varying rates, subject to a maximum of £160 per annum, is also payable. Quarters are provided at a rental of 10 per cent of salary. Free passages in both directions for officer and wife, and up to the cost of one adult fare for children. Income tax at local rates. Tour of service is from 40 to 48 months. Annual local leave is permissible and generous home leave is granted after each tour. Social and recreational amenities are good. Educational facilities for children are available. Medical officers in Kenya are eligible for promotion to administrative super-scale posts, and also, on acquiring specialist qualifications and experience, for numerous specialist appointments in Kenya and other Colonial territories. Candidates must possess medical qualifications registrable in the United Kingdom. Application forms can be obtained from the Director of Recruitment (Colonial Service), Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1 (quoting reference No. 27215/152/52). (9909)

UNIVERSITY APPOINTMENTS

CHARING CROSS HOSPITAL MEDICAL SCHOOL, 62, Chandos Place, London, W.C.2.
 There are vacancies in the Anatomy Department for a

LECTURER
 (minimum salary £800 per annum) and for an **ASSISTANT LECTURER**
 (minimum salary £600 per annum).
 The appointments are whole-time. Further details and forms for application may be obtained from the Secretary. (9839)

INSTITUTE OF UROLOGY
 (In association with St. Peter's, St. Paul's, and St. Philip's Hospitals)

TWO SENIOR RESEARCH ASSISTANTS
 Applications are invited from registered medical practitioners holding a higher qualification, and of consultant status, for research into malignant disease of the urinary tract. Appointment, part-time for one year in the first instance, renewable annually. Salary £500 per annum. NUFFIELD FOUNDATION DOMINION TRAVELLING FELLOWSHIPS

The Nuffield Foundation offers a Travelling Fellowship in Medicine to nationals of New Zealand, preferably between the ages of 25 and 35 years. The purpose is to enable medically qualified persons to obtain in the United Kingdom such postgraduate training and experience as may be necessary to prepare them to undertake medical teaching and research work in New Zealand. Applicants should possess high intellectual and personal qualities. A Fellow will be required to carry out, at an approved institution, a programme of work and training approved by the Nuffield trustees. A Fellow will not be permitted to prepare for, or to take examinations for, higher degrees or diplomas awarded by bodies in the United Kingdom. The Fellowships are normally tenable for one year and provide for return travelling expenses of a Fellow and, if he is married, for his wife. The total value of an award, including travelling expenses, varies with the needs and family responsibility of the holder, but will in no case be less than £900. Applications, for Fellowships to begin in 1952, should be submitted not later than April 26, 1952, to the undersigned. Copies of the conditions, and forms of application, are also available at the Nuffield Foundation, 12, Mecklenburgh Square, London, W.C.1.—R. E. Corbett, Department of Chemistry, University of Otago, Dunedin, New Zealand. (9939)

UNIVERSITY OF ABERDEEN
RADIOGRAPHER in the Department of Anatomy
 Applications are invited for the above post. Salary £520 per annum with F.S.S.U. Applications to be lodged with the undersigned before April 14, 1952.—H. I. Butchart, Secretary, University of Aberdeen. (9819)

UNIVERSITY OF SHEFFIELD
 Applications are invited for a post of **LECTURER IN ANATOMY**
 to begin duties as soon as possible, and in any case not later than October 1, 1952. Salary scale: Lecturer, £700 by £100 to £1,500. Commencing salary (in range £700 to £1,000), according to qualifications and experience, with superannuation provision under the F.S.S.U., and a family allowance. Applications (four copies), together with the names and addresses of referees, and, if desired, copies of testimonials, should reach the undersigned (from whom further particulars may be obtained) not later than April 19, 1952.—A. W. Chapman, Registrar (9913)

POSTAL COACHING FOR ALL MEDICAL EXAMINATIONS. Examination successes. 1938-1951: M.D.Lond., 65; M.B., B.S.Lond., Final, 152; F.R.C.S.Eng., Primary, 197; F.R.C.S.Eng., Final, 185; M.R.C.P.Lond., 204; M.R.C.S., L.R.C.P., Final 331; D.A., 181; D.C.H., 139; M. and D.Obst.R.C.O.G., 221; D.O., C.P.H., D.P.H., D.L.O., D.P.M., F.R.C.S.Edin., many successes. Assistance with M.D. Thesis. Prospectus, list of tutors, etc., on application to Dr. G. E. Oates, University Examination Postal Institution, 17, Red Lion Square, London, W.C.1. Phone: HOLborn 6313.

ROYAL FREE HOSPITAL GROUP

General practitioners are invited to attend a course of

CLINICAL DEMONSTRATIONS AND DISCUSSIONS

to be held at the Hampstead General Hospital by members of the medical and surgical staff of the Group. Further particulars may be obtained from the Administrative Officer, Hampstead General Hospital, The Green, N.W.3. (9840)

THE ROYAL INSTITUTE OF PUBLIC HEALTH AND HYGIENE

The Certificate, and the Diploma, in Public Health and the Diploma in Industrial Health

The next bi-annual Course of Instruction for the Certificate in Public Health (C.P.H.) will commence on March 21, 1952. This leads to Courses both for the Diploma in Public Health and for the Diploma in Industrial Health. All Courses may be taken either whole-time or part-time. Prospectuses, enrolment forms, and full details may be obtained from the Secretary, 28, Portland Place, London, W.1. (Telephone: Langham 2731-2). (9108)

UNIVERSITY OF EDINBURGH Faculty of Medicine**DIPLOMA IN PSYCHIATRY**

An intensive five-weeks' Postgraduate Course, as part of the requirements for the Diploma in Psychiatry, will be held during the Autumn Term, 1952, from Monday, October 6, to Saturday, November 8. The course will include instruction in psychiatry, psychology, neurology, neuro-anatomy, neuro-physiology, neuro-pathology, mental deficiency, etc., and will occupy the full time of those attending. While primarily intended for medical graduates or licentiates who have been registered as candidates for the Diploma in Psychiatry of the University, the Course is open to other medical practitioners who may wish to attend. The fee for the Course is 25 guineas, and a matriculation fee of £1 1s. 6d. (or £2 12s. 6d. in the case of candidates for the Diploma) is also payable. The course will be held only if a sufficient number of enrolments are received, and application for admission to the Course should be sent to the Dean of the Faculty of Medicine, University New Buildings, Edinburgh, 8, not later than June 30, 1952.—Sydney Smith, Dean of the Faculty of Medicine. (9940)

UNIVERSITY OF EDINBURGH Faculty of Medicine**D.M.R.D. and D.M.R.T. (Univ. Edin.)**

The Courses of instruction for the Diploma in Medical Radiodiagnosis and the Diploma in Medical Radiotherapy, which are offered by the University of Edinburgh, will commence on October 7, 1952. The Courses, which are open to practitioners holding recognized medical qualifications, include lectures and practical instruction, and extend over a period of two years. They are held in the University, the Royal Infirmary, and other approved hospitals. The cost of the Courses is: For the D.M.R.D. £70 7s.; For the D.M.R.T. £80 17s. Full particulars can be supplied by the Dean of the Faculty of Medicine, The University, Edinburgh, 8. For both Courses there is available a limited number of S.H.O. appointments. Preference will be given to candidates holding higher medical qualifications. Applications for the Courses, and for the S.H.O. appointments, should be submitted, in the first instance, to the Dean of the Faculty of Medicine as soon as possible, and not later than April 30, 1952. (9942)

UNIVERSITY OF EDINBURGH Faculty of Medicine**COURSE OF INSTRUCTION IN MEDICAL ILLUSTRATION**

Applications are invited for the new session of the above course of instruction commencing in October, 1952. This course extends for a period of three years and is particularly suited to those who are considering medical illustration as a profession. Applications should be made on the prescribed form, which is obtainable from the Dean of the Faculty of Medicine, University New Buildings, Teviot Row, Edinburgh, 8. Candidates must be not less than 18 years of age, and must have a good secondary education with a knowledge of general art.—Charles H. Stewart, Secretary to the University. (9820)

LECTURES**ROYAL EYE HOSPITAL (King's College Hospital Group)**

A Course of Lectures will be held during the Spring Term on clinical subjects and refraction. Further particulars are obtainable on application to the Secretary, Royal Eye Hospital, St. George's Circus, S.E.1. (9943)

UNIVERSITY OF GLASGOW**NOAH MORRIS MEMORIAL LECTURES**

Dr. William N. Pickles, M.D., D.Sc., M.R.C.P., will deliver a lecture on "Epidemiology in Country Practice" in the lecture theatre of the Chemistry Department on Wednesday, April 16, at 4.30 p.m. The lecture is open, without ticket, to all interested. (9908)

SITUATIONS VACANT

North Devon Hospital Management Committee.—Pathological Laboratory, Bouthport Street, Barnstaple. Applications are invited for the post of Technician or Junior Technician in a new laboratory serving the North Devon District. Considerable experience in haematology is essential. Salary and conditions in accordance with Whitley Council scales. Applications, stating age, qualifications and experience, together with the names of two referees, to the Pathologist at the above address. (8108)

PHARMACISTS, DIETITIANS, DISPENSERS, NURSES VACANT

Dispenser required for country practice. Single flat available unfurnished.—Box 942, B.M.J.
Dispenser Bookkeeper required in old established mixed practice 40 miles from London. Immediate vacancy.—Box 1138, B.M.J.

AVAILABLE

Dispenser, Hall certificate, car driver, seeks Locums. May to August.—Box 1115, B.M.J.
Lady dispenser (Hall), fifteen years' experience with doctors, available for holiday relief.—Box 1123, B.M.J.
S.R.N. with Canadian obstetrics, late P.M.R.A. F.N.S., touch typist, some shorthand, 32 years old, seeks post West London area.—Box 1122, B.M.J.

RECEPTIONISTS, SECRETARIES, TYPISTS, HOUSEKEEPERS, ETC.**AVAILABLE**

The Notification of Vacancies Order, 1952, provides that the services of any advertiser under this heading may be engaged only through the medium of the Local Employment Exchange or approved Employment Agency, unless he or she is over the age of 64 or 59 respectively, or otherwise excepted from the provisions of that Order.

Educated lady (35), requires post as Receptionist, Clerk to doctor or dentist, S.W.1, 3 or 7 districts preferred. No shorthand.—Box 1139, B.M.J.
Elderly lady, pleasant personality, reliable, hard working, active, is highly recommended and seeks post as Receptionist/Secretary to London doctor/specialist. Trained nursing sister, has also managed large airways hotel overseas and more recently a large country estate in U.K. Business and secretarial experience. Typing.—Box 1124, B.M.J.
Secretary/Receptionist, quick, accurate, shorthand typist, good medical experience, requires full- or part-time position, London. Highest references.—Box 1114, B.M.J.

Applicants requiring testimonials, theses, copied or duplicated should communicate with Manton Secretarial Service, Ltd., 98, Victoria Street, S.W.1 (Victoria 0141), who are specialists.

General Practitioners. Your tedious paper work, correspondence, accounts, etc., dealt with at economic hourly rates by fully experienced reliable Secretary specializing medical work. Available at your convenience for occasional/regular, short/longer periods, also evenings and Saturdays. Own typewriter.—Mary Simon, 58, Heath Street, N.W.3. Telephone mornings: HAM 5216.

Thoroughly trained Medical Secretarial staff may be engaged through Brook Street Bureau, Ltd., 59, Brook Street, W.1, Gro. 6666, and 2, George Street, Croydon. Phone: 3363.

CONSULTING ROOMS, ETC.**AVAILABLE**

Queen Anne Street, well furnished, bright consulting room for part-time or occasional use, now available, moderate rent.—Box 1155, B.M.J.
Wimpole Street. Attractive ground-floor Consulting Room, partly furnished, use of waiting-room. Accommodation for Secretary, usual service. Box 1035, B.M.J.

HOLIDAY ACCOMMODATION

Modern farmhouse, farm attached, on the South Cardiganshire coast, would welcome family of four to six, own dining-room and sitting-room, and bathroom. Excellent food, every comfort. Not far from all the bays on the coast. Prettiest spot in Wales. Box 1116, B.M.J.

South Cornwall.—On seafront. Comfortable holiday accommodation in doctor's house.—Box 1126, B.M.J.

HOUSES FOR SALE

For sale. Long lease of house. Pleasant town in Eire. Suit doctor.—Apply William Golden, Auctioneer, Mallow, Eire.

HOTELS

CORNWALL.—TREHARROCK MANOR AND FARM. Jersey herd. Log fires. Spring is here. Golf St. Enodoc. Trout and salmon. Near Polzeath (surf-bathing). Lundy Bay. Port Quin and Port Gaverne.—Port Isaac 234.

DEVON, SOUTH.—DUNMORE HOTEL, Shaldon, standing in seven acres of secluded gardens, with unrivalled sea views. Private suites, sun lounges, magnificent ballroom. En-Tout-Cas tennis court, boating, bathing, fishing, golf. Licensed. Excellent cuisine. Special diets if required.—Tel.: Shaldon 250/251. Main line railway station, Teignmouth.

DEVON, SOUTH.—YEALM HOTEL, Newton Feners, near Plymouth. Sheltered and sunny position overlooking harbour in famous beauty spot. Combining sea, river and country. Tennis, sailing, bathing, fishing, riding, boating. Fully licensed. Brochure. Tel.: 419.

INVERNESS-SHIRE.—NETHYBRIDGE HOTEL, Nethybridge. Situated in the sheltered valley of Strathspey 10 miles from Aviemore and 5 miles from Grantown-on-Spey. Private suites, Passenger lift, Golf, tennis, fishing, climbing, A.A. and R.A.C. Send for brochure to Hugh Ross, Manager. Telephone: Nethybridge 203.

SUSSEX.—ROYAL VICTORIA HOTEL, St. Leonards-on-Sea. 51 gns. weekly inclusive. October to May in this first-class, A.A. 4 star R.A.C. hotel.

CRUISES

Round Voyages by first-class Cargo/passenger vessels. Portugal 3 to 3½ weeks, £65. Spain 4 to 5 weeks, £85. N. Levant 6 to 8 weeks, £130. W. Africa or S. America, 3 months, £190. Write Bowerman Bros., Dept. D., 28, Ely Place, London, E.C.1. HOL 1887/8.

MOTOR CARS, HIRE, ETC.

For sale, Ford 10, 1935, reliable runner.—Phone Eus. 7520 after 7 p.m.

Brooklands of Bond Street. Individually in new and used cars. Sole London distributors Alvis, Aston Martin, Healey, Lagonda. Latest models. Ferrari concessionaires. Don't be swayed from your purpose. Buy or sell your car at 103, New Bond Street, London, W.1. Mayfair 6351/6.

If you have a 1949/50 car, for disposal, send details to King, "Ashley," Penington Road, Beaconsfield (Bucks) 1306.

Priority Motor Repairs Service for members of the medical profession. Mechanical and coachwork repairs, recollussing, lubrication service and valeting. Free collection and delivery within three miles' radius for repairs costing £2 10s. or more.—Mann Egerton & Co., Ltd., 68, York Way, King's Cross, N.1. Tel.: TER 7772. (Two minutes' walk King's Cross underground and main line stations.)

Vanguard or similar type car wanted immediately.—Morley, 54, Streatham Hill, London, S.W.2. Tulse Hill 4489.

MISCELLANEOUS

For Sale, Beck Microscope, 2 eyepieces, lens 2/3, 1/6, 1/12. Abbe condenser. Movable stage. Case Beautiful condition, £50 or offers.—Box 1140, B.M.J.

For Sale. Half Skeleton. Best offer over £7.—Box 1156, B.M.J.

X-ray genuine Lysholm grid 15 by 12 in., £25. Fluorescent screen Levy-West 15 by 12 in., chromium, £18.—Box 1125, B.M.J.

Portable Boyles Anaesthetic Apparatus three rotameter head, complete with cylinder stand, fibre case, laryngoscope, other accessories. £75 or offer.—Purvis, 46, Clarges Street, W.1.

Brass, plastic, bronze nameplates with cream lettering for your surgery. Free estimates from Reliance (Nameplates), Ltd., Richmond Bridge Works, Twickenham. POP 2283.

Bronze Name Plates with cream enamel lettering. Send size and lettering for estimate.—Osborne, 117, Gower Street, London, W.C.1.

Gramophone Records bought, sold, and exchanged. Small lots or whole collections purchased. L.P. records supplied to order, post free, anywhere (limited stocks of second-hand copies in fine condition also available). If you cannot call send for regular lists.—H. C. Harridge, 8, Moor Street, Cambridge Circus, London, W.1.

Microscopes. Highest prices paid for good modern types. Send or bring your equipment for valuation. Wallace Heaton, Ltd., 127, New Bond Street, W. (May 7511.)

NURSING HOMES

Northwoods, Winterbourne, Bristol. A Registered Nursing Home in charming surroundings for elderly people needing nursing, warmth, comfort, good food, and ample dairy produce. From 6 guineas a week. Apply to the Matron.

Special Number on

EMERGENCIES IN GENERAL PRACTICE

APRIL 1952

The Emergencies of Medicine are the touchstone of general practice. When they occur, the practitioner has to be prepared to act immediately, as it is on these decisions, more than any other, that his action may mean the difference between life and death. In this Special Number the emergencies are dealt with in an essentially practical manner by leading authorities.

Principal Contents

CARDIAC EMERGENCIES

By C. J. GAVEY, M.D., F.R.C.P. Physician and Physician-in-charge, Cardiographic Department, Westminster Hospital.

RESPIRATORY EMERGENCIES

By N. LLOYD RUSBY, D.M., F.R.C.P. Assistant Physician, London Hospital; Physician, London Chest Hospital.

ABDOMINAL EMERGENCIES

By R. MILNES WALKER, M.S., F.R.C.S. Professor of Surgery, University of Bristol.

PAEDIATRIC EMERGENCIES

By R. W. B. ELLIS, O.B.E., M.D., F.R.C.P. Professor of Child Life and Health, University of Edinburgh.

OBSTETRICAL EMERGENCIES

By H. HARVEY EVERS, M.S., F.R.C.S., F.R.C.O.G. Professor of Obstetrics and Gynaecology, University of Durham; Gynaecologist, Royal Victoria Infirmary, and Obstetrician, Princess Mary Hospital, Newcastle upon Tyne.

NEUROLOGICAL EMERGENCIES

By ERIC C. O. JEWESBURY, D.M., M.R.C.P., D.P.M. Neurologist, Royal Northern Hospital, and North Middlesex Hospital.

PSYCHIATRIC EMERGENCIES

By E. W. ANDERSON, M.D., F.R.C.P., D.P.M. Professor of Psychiatry, Victoria University, Manchester; Physician, Royal Infirmary, Manchester.

GENITO-URINARY EMERGENCIES

By ARTHUR JACOBS, F.R.F.P.S. Surgeon-in-charge, Urological Department, Glasgow Royal Infirmary.

EMERGENCIES IN INFECTIOUS DISEASES

By FRANK KER, O.B.E., T.D., M.B., Ch.B. Acting Medical Superintendent, Little Bromwich Hospital for Infectious Diseases, Birmingham.

DIABETIC EMERGENCIES

By W. G. OAKLEY, M.D., F.R.C.P. Physician, King's College Hospital Diabetic Department.

DERMATOLOGICAL EMERGENCIES

By F. F. HELLIER, O.B.E., M.D., F.R.C.P. Dermatologist, General Infirmary, Leeds.

ANAESTHETIC EMERGENCIES

By H. W. FEATHERSTONE, O.B.E., M.D., LL.D., F.F.A.R.C.S. Senior Anaesthetist, United Birmingham Hospitals.

EMERGENCY TREATMENT OF BURNS AND SCALDS

By PATRICK CLARKSON, M.B.E., M.B., F.R.C.S. Casualty Surgeon, Guy's Hospital; Plastic Surgeon, Basingstoke Plastic Unit and the Royal Northern Hospital.

CURRENT THERAPEUTICS LII.—AMOEBICIDES

By A. R. D. ADAMS, M.D., F.R.C.P., D.T.M. Physician for Tropical Diseases, Royal Liverpool United Hospital.

In addition, this issue will contain all the regular features:

REVISION CORNER	NOTES AND QUERIES	PRACTICAL NOTES	REVIEWS OF BOOKS	NEW PREPARATIONS
	140 pages of text.	Price 7s. 6d.	By post 8s. 0d.	

RECENT AND FORTHCOMING NUMBERS

The following numbers are now in course of preparation:

DISEASES OF THE SKIN

CARDIOVASCULAR DISEASE

FERTILITY AND INFERTILITY

Subscriptions can be back-dated to include any of the following numbers, or they can be bought separately at 4s. each, by post 4s. 4d.

DISEASES OF THE BLOOD (March 1952)

DISEASES OF THE EAR (November 1951)

DISEASES OF THE MOUTH (February 1952)

ADVANCES IN TREATMENT (October 1951)

DISEASES OF CHILDHOOD (January 1952)

(Special Number—1000th ISSUE Price 7s. 6d., by post 8s.)

UPPER RESPIRATORY DISEASES (December 1951)

★ The annual subscription is £2 2s. post free to any part of the world. Medical students are granted a subscription concession at 25s. per annum. ★

VERILOID
INTRAVENOUS SOLUTION
... a new achievement
in the control of —
HYPERTENSIVE
CRISES

**A SAFE AND POWERFUL HYPOTENSIVE AGENT
 CAPABLE OF REDUCING BLOOD PRESSURE
 TO NORMAL LEVELS WITHIN MINUTES IN
 A GREAT MAJORITY OF PATIENTS.**

*In boxes of 6
 ampoules of
 5 cc.*

Veriloid Intravenous Solution is an important new emergency drug. By its use, immediate control of arterial tension is possible in those conditions in which a continued hypertensive state could readily lead to disaster. It therefore finds valuable application in the emergency treatment of malignant hypertension, encephalopathy, eclampsia and hypertensive states accompanying cerebral vascular disease. After tension has been controlled by Veriloid Intravenous Solution, oral treatment with Veriloid tablets can be instituted and continued indefinitely.

Veriloid Intravenous Solution contains 0.4 mg. of Veriloid brand alkaloids of *Veratrum viride* in each c.c. and is biologically assayed to ensure uniform hypotensive potency. It is a very potent agent, and should not be used before the instructions for use have been carefully studied.

PEPTIC ULCER THERAPY

AN EFFECTIVE METHOD of relieving the symptoms of hyperchlorhydria and peptic ulceration is provided by Collubarb Tablets, containing aluminium hydroxide (Collumina brand) 5 grains (0.32 gm.) phenobarbitone $\frac{1}{4}$ grain (0.016 gm.) and atropine sulphate $\frac{1}{500}$ grain (0.13 mg.).

A Three-fold Function

- 1 The aluminium hydroxide neutralises excess acid without producing an alkaline condition of the stomach.
- 2 The phenobarbitone helps to relieve the anxiety tension so often associated with hyperchlorhydria and peptic ulceration.
- 3 The small dose of atropine sulphate moderates excessive motor activity of the gastro-intestinal tract with diminution of secretion of gastric juice.

Cartons of 24 and 100 (film wrapped) Containers of 500

HARVEY

1578—1657

This scientist and doctor of medicine rose to great eminence and became Physician Extraordinary to James I. He is most famed, however, for his research work on the blood and his discovery of its circulation.

IMPROVED PRESENTATION

FOR IRON DEFICIENCY ANÆMIAS, ferrous sulphate is universally accepted as the most efficient compound for oral administration. The improved method of presentation in 'Plastules' ensures *maximum* absorption and utilisation. The tasteless, easy-to-swallow capsules rapidly disintegrate and the ferrous sulphate in a semi-solid condition is quickly absorbed, with avoidance of gastric irritation. The addition of Folic Acid stimulates production of erythrocytes, and the dried yeast increases appetite and re-inforces the action of the iron.

'Plastules' are available in four varieties: Plain; with Liver Extract; with Folic Acid; and with Hog Stomach.

"SANOID" STERILISED SURGICAL CATGUT

Prepared under M.O.H. Licence No. 40

Over forty years' experience is behind the manufacture of "Sanoid" Sterilised Surgical Catgut. Our capacity has recently been considerably increased to enable us to fulfil increased demand

TENSILE STRENGTH: "Sanoid" Surgical Catgut easily surpasses official requirements for minimum average strength.

GAUGING: Every strand of "Sanoid" Surgical Catgut has been checked at four points by dial micrometer.

FLEXIBILITY: Heat treatment necessarily tends to make catgut to some degree wiry and brittle due to loss of moisture, but the composition of the solution in which "Sanoid" Surgical Catgut is tubed is such that the maximum possible strength and flexibility are restored to the gut and retained by it under long storage periods.

SMOOTHNESS: "Sanoid" Surgical Catgut is of great smoothness, but at the same time holds securely on the knot.

STERILITY: "Sanoid" Surgical Catgut conforms to the stringent bacteriological tests for sterility as laid down by the Ministry of Health in the Therapeutic Substances Regulations.

We invite your inquiries for Catgut and other Surgical Ligatures. Samples will be provided with pleasure.

SOME MEDICAL ASPECTS OF TOBACCO-SMOKING*

BY

RONALD BODLEY SCOTT, M.A., D.M., F.R.C.P.

Lately Physician to the King's Household; Assistant Physician, St. Bartholomew's Hospital; Physician, the Woolwich Memorial and Surbiton General Hospitals

Of all the imports for which the Old World is indebted to the New, none equals in medical interest two which anticipated the Lease-Lend Act by nearly 450 years—syphilis and tobacco. It is of the second, the only drug to which addiction is universally considered respectable, that this paper treats.

Historical

So far as Western civilization is concerned, the history of tobacco begins on October 13, 1492, when Christopher Columbus landed on the island he named San Salvador. The natives sought to propitiate their visitors with rare gifts, including among them some dried leaves, which the Spaniards later threw away with smiles of condescension at the artless generosity of the savages. Nevertheless, within fifty years these leaves were eagerly sought in Europe, and were recommended for their medicinal properties by the French Ambassador at Lisbon, Jean Nicot, who later gave his name to nicotine. A century later the habit of pipe-smoking had firmly established itself in England. It survived the fulminations of James I, who published his *Counterblaste to Tobacco* within a year of coming to the throne, stigmatizing smoking as a "custome loathsome to the eye, hatefull to the nose, harmfull to the braine, dangerous to the lungs, and, in the black stinking fume thereof, nearest resembling the horrible Stygian smoke of the pit that is bottomlesse." The milder strictures of Charles II, who forbade Cambridge men to "wear periwigs, smoke tobacco or read their sermons," were equally ineffective. In Continental countries, where deterrents were more vigorous, the habit spread less rapidly: in Russia, smokers were discouraged by amputation of the nose, and in the Swiss Canton of Berne the offence was ranked as only one degree less odious than adultery. A prohibition against smoking in the streets was rigidly enforced by the police in Berlin up to 1848.

The habit has now become so universal that the occasional non-smoking compartment in railway carriages, which has long since replaced that formerly labelled "smoker," seldom contains more than one old lady. The increase has been due to the cigarette, a South American invention of the 1750's, which reached Europe through the Peninsula and was made fashionable by Louis Napoleon after the Crimean War. So vast has the consumption of tobacco become that the duty paid

on it affords the Chancellor of the Exchequer one of his main sources of revenue, providing him in 1950 with £601,651,432. The moralist will find matter for reflection in the thought that over one-quarter of the country's income is now derived from the addiction of its inhabitants to tobacco and alcohol.

Much ingenuity has been expended in efforts to explain the attraction of tobacco-smoking. "I cannot imagine what pleasure they derive from this practice," wrote Oviedo in 1526, "unless it be the drinking which invariably precedes the smoking." He continues: "I am aware that some Christians have already adopted the habit, especially those who have contracted syphilis, for they say that in the state of ecstasy caused by the smoke they can no longer feel their pain." Of recent years less naive reasons have been postulated: the atavistic lure of fire worship, a pleasurable stimulation of the vagal nerve endings, and a rise in the blood-sugar level have all had their champions (Finnegan, Larsen, and Haag, 1945). The psychiatrists have made their characteristic contribution to the problem. "Getting something orally," one asserts (Bergler, 1946), "is the first great libidinous experience in life"; first the breast, then the bottle, then the comforter, then food, and finally the cigarette. More mundane, but perhaps better founded, is the suggestion that a true addiction to nicotine is at least part of the explanation (Finnegan, Larsen, and Haag, 1945; Johnston, 1942).

The Pharmacology of Smoking

The pharmacology of tobacco-smoking is more complex than at first appears; nicotine is the only alkaloid of importance in the leaf, but at least eleven others are recognized, although their biological actions are uncertain. Estimates of the quantity of nicotine entering the mouth during smoking vary: earlier reports claimed amounts as great as 3.6 mg. per cigarette, of which 90% was said to be absorbed (Pierce, 1941). More dependable assays are in the region of 1 mg. per cigarette weighing 1 g., 2.69 mg. per gramme of pipe tobacco, and 0.7-1.6 mg. per gramme of cigar (Ling and Wynn Parry, 1949). The proportion absorbed varies directly with the "wetness" of the smoker and inversely with the length of the cigarette-holder or pipe-stem. In the case of a cigarette smoked without a holder, it is estimated at about 0.5 mg., and this is borne out by comparing the antidiuretic effect of one cigarette with that of 0.5 mg. of nicotine given by injection (Burn, Truelove, and Burn, 1945). After smoking 20 cigarettes in seven hours the quantity of nicotine in the blood reaches an average of 0.14 mg. per litre; lower levels result from pipe or cigar

* A lecture delivered to the Bournemouth Medical Society on January 9.

smoking. It is remarkable that traces of nicotine can still be found in the blood ten hours after the last cigarette has been smoked (Wolff, Hawkins, and Giles, 1949).

Doses of 1-6 mg. of nicotine, by subcutaneous injection, are enough to produce such symptoms as sweating, faintness, tachycardia, nausea, and vomiting in non-smokers; much larger doses are tolerated by the habitué (Johnston, 1942). Nicotine's main effect is on the sympathetic nerve endings, first stimulating and later paralyzing them. Cigarette smoke, however, contains a large number of other products, such as hydrocyanic acid, ammonia, carbon monoxide, pyridines, aldehydes, and tars. It is possible that the nausea and vomiting which occasionally assail the neophyte may be due to some of these substances. A man who habitually smokes 20 cigarettes a day absorbs enough carbon monoxide to maintain 5% of his haemoglobin in the carboxy form (Dixon, 1921).

Some observations on the mechanics of smoking are of interest. The average smoker consumes one cigarette in 17 puffs, with each of which he draws into his mouth 33 ml. of air; every 66 seconds he inhales the smoke, but by the time it has reached his lungs it has been diluted fifteenfold by the air in his respiratory passages (Fabricant, 1946).

The Physical Effects of Smoking

It is clear that the uses of tobacco and the effects of smoking upon the healthy and upon the diseased body must be a matter of close concern to our profession. The herb has, in fact, aroused medical interest ever since its introduction to Europe. It was for its medicinal virtues that it was cultivated in the sixteenth century, when, for a time, it enjoyed the reputation of a panacea. Application of tobacco leaves would heal a cancerous ulcer, it was claimed, and the apparently drowned were rapidly revived by insufflation of tobacco smoke into the rectum when they were suspended by the heels. It was widely used as a prophylactic against infection, and in 1665 the boys at Eton were given instruction in smoking, that they might ward off the plague; one pupil has recorded that he was never flogged so severely as when he refused his pipe.

Gradually attention shifted from the beneficent to the malignant effects of tobacco. The Victorian attitude accorded well with the view that any custom so enjoyable as smoking must of necessity be harmful; and in 1856 Mr. Samuel Solly was thundering at the students of St. Thomas's Hospital: "Now don't be frightened, my young friends, I am not going to give you a sermon against smoking, that is not my business; but it is my business to point out to you all the various and insidious causes of general paralysis, and smoking is one of them. . . . I know of no single vice which does so much harm as smoking."

Much of the writing on the medical aspects of tobacco-smoking has come from the pens of non-smokers or of those who have renounced the habit and are basking in the sunshine of their own righteousness. For these reasons the appeal is often to the emotions rather than to the intellect. As recently as 1937, an English physician (J. D. Rolleston, 1937) wrote: "The three greatest statesmen of our time, Mussolini, Hitler, and Mr. Gladstone, did not smoke"; his paper closed with a plea to join the National Society of Non-Smokers and to subscribe to its journal, *Clean Air*.

This approach to the problem has made it difficult for us to offer our patients rational advice on the question, and I turn now to the consideration of some of the established facts regarding the effects of this habit. It has been proved that non-smokers live longer than smokers (Pearl, 1938), and that the decrease in survival is greater for heavy than for moderate smokers. Once the age of 70 years has been passed the harmful effects are no longer apparent. In another series (Short, Johnson, and Ley, 1938-9) the effect of smoking was investigated in 2,031 persons proposing for life assurance; 63.7% of these were habitual smokers and 24.4% had never smoked; the two groups were homogeneous in respect of age and sex. No differences in weight, blood

pressure, or pulse frequency existed between them, but the smokers were more prone to colds in the head and complained more frequently of cough, palpitation, dyspnoea, and dyspepsia.

Its Effects upon the Cardiovascular System

It will be more profitable, however, for our present purpose to consider the various systems of the body and the effects tobacco is said to have on them. I begin with the cardiovascular system. Tobacco has a well-defined pharmacological action on the heart and blood vessels; the blood pressure shows a transient rise, averaging 15 mm. for the systolic and 10 mm. for the diastolic pressures; the pulse frequency increases by an average of 8 beats a minute; changes in the electrocardiogram, consisting of lowering, or even inversion, of the T waves, are frequent (Graybiel, Starr, and White, 1938; Stewart, Haskell, and Brown, 1945; Levy, Mathers, Mueller, and Nickerson, 1947). These disturbances are ephemeral and disappear when the cigarette is finished. Significant alterations occur also in the peripheral circulation: the skin temperature falls and the volume of the hand, as measured by the plethysmograph, diminishes (Lampson, 1935). These changes are undoubtedly the result of arterial narrowing, but it has been pointed out that a reflex peripheral vasoconstriction takes place whenever a deep breath is drawn and that inhalation alone might be responsible for the decrease in limb volume (Mulinos and Shulman, 1940). However, it has now been established that a progressive reduction in the volume of the limb occurs while cigarettes are being smoked, as well as the transient decrease which accompanies each inhalation (Shepherd, 1951). It must therefore be accepted that cigarette-smoking does lead to constriction of peripheral vessels, although it is possible that these effects are brought about by nicotine stimulating the release of adrenaline from the suprarenal glands (Short and Johnson, 1938-9).

These phenomena are, as I have stressed, manifestations of the pharmacological action of tobacco; it will be obvious that symptoms due to pre-existing cardiovascular disease may be aggravated by them, but there is no proof that tobacco initiates such disease. Nevertheless this contention is often made, and one or two specific instances must be considered. "Smoker's heart," an expression more familiar to our fathers than to us, was applied to a state in which premature contractions occurred in heavy smokers; it seems possible that this causal sequence is to be observed in some patients, but it is decidedly rare. It was regarded more seriously 45 years ago: tobacco might, it was said, "increase vascular tension and lead to tumultuous and forcible cardiac action"; persistence in the habit after these warnings might cause dilatation of the heart with very much more serious symptoms, which might even be fatal (Essex Wynter, 1907).

Attempts have been made to incriminate smoking as a cause of coronary artery disease, but in one series of 750 patients with angina the percentage of smokers was considerably lower than the percentage of non-smokers (White and Sharber, 1934). In another group of 1,000 men above the age of 40 years with evidence of coronary artery disease, 69.8% were smokers, while the figure for a control group without heart disease was 66.3%. Nevertheless, between the ages of 40 and 49 years 1% of non-smokers were found to have evidence of coronary artery disease, while in mild to moderate smokers the incidence was 4.6%, and in heavy smokers 5.9% (English, Willius, and Berkson, 1940). It is hardly necessary to point out that these observations do not imply a causal relationship: everyday experience suggests that the kind of man who has a coronary thrombosis before he is 50 is the kind of man one expects to smoke 25 cigarettes a day.

In some patients tobacco undoubtedly provokes anginal pain. In the majority there are convincing signs of disease of the coronary arteries, and smoking produces its effects by its action in raising the blood pressure and increasing the heart rate (Pickering and Sanderson, 1944-5). Very

occasional instances are recorded of what may with accuracy be called "tobacco angina": in one of these pain was provoked by smoking but not by exertion, there was no rise in blood pressure or heart rate, but transient changes in the ST segments of the electrocardiogram were noted. It was suggested that spasm of the coronary arteries induced by tobacco was responsible (Bryant and Wood, 1947).

The therapeutic deduction seems to be that patients in whom anginal pain follows smoking should be advised to abstain. There is not sufficient reason for forbidding all patients with angina to smoke, although a period of abstinence as a therapeutic trial is justifiable.

In the genesis of peripheral vascular disease tobacco has long been regarded as important. Every medical student reads in his textbooks that thrombo-angiitis obliterans occurs predominantly in chain-smoking Russian Jews. There is now dispute over the very existence of this disease; it is suggested that the name covers a multitude of pathological processes and that it is not to be distinguished from the senile variety of obliterative arterial disease (Boyd, Ratcliffe, Jepson, and James, 1949). It is still, however, the general belief that thrombo-angiitis obliterans is a specific morbid entity and that smoking is more dangerous in it than in senile obliterative arteritis. It has been claimed that occlusive vascular disease is more common in diabetics who smoke than in those who do not; in one series it was noted in 58% of smokers and in only 37% of non-smokers (Weinroth and Herzstein, 1946).

Although skin-sensitivity tests with extracts of cigarette smoke were reported as positive in 83% of patients with thrombo-angiitis obliterans and in only 10% of normals (Harkavy, Hebal, and Silbert, 1932-3), and although allergy to tobacco has been postulated as the basis of this complaint (Sulzberger, 1934), no evidence exists which convincingly incriminates smoking as a cause of this or any other peripheral vascular disease. Injections of nicotine into growing rats do not increase the incidence of arterial change (Thienes and Butt, 1938). The danger is due to the vasoconstrictor effects of tobacco, and there is unanimous agreement that sufferers from peripheral vascular disease should not smoke. It is not clear how much difference this interdiction makes to the elderly man with intermittent claudication; but when there is gangrene or the vitality of the skin is in doubt the ban should be absolute. The additional vasoconstriction may be enough to prevent healing or to precipitate death of tissue. One observer followed up 100 patients with thrombo-angiitis obliterans, who had ceased to smoke, over a period of ten years; in every case the disease was arrested (Silbert, 1945).

Its Effects upon the Respiratory System

In the respiratory system the irritant action of tobacco smoke might reasonably be expected to overshadow any systemic effects. We are all familiar with the patient who replies to our query with, "Just a smoker's cough, doctor," and, although he may have bronchiectasis, carcinoma of the lung, or pulmonary tuberculosis, a "smoker's cough" must be admitted. Tobacco smoke has a considerable local irritant action; a method of measuring this by the effect of six "standard puffs" of cigarette smoke in producing oedema of the rabbit's conjunctiva has been devised (Finnegan, Fordham, Larsen, and Haag, 1947). Researches show that different brands vary greatly in their irritant action, probably owing to substances added in the manufacture. Persistent heavy cigarette-smoking will certainly lead to a chronic pharyngitis and will keep alight chronic bronchitis in those predisposed. Apart from these obvious irritant effects, recent observations, showing that it reduces vital capacity and chest expansion, provide scientific justification for the belief that it is "bad for the wind" (Whitfield, Arnott, and Waterhouse, 1951).

Asthma due to tobacco must be very rare, although the case is recorded of a Turkish lady who was sensitive to cigars and was afflicted by asthma when she walked in the

grounds of her estate, which adjoined a tobacco plantation (Urbach and Gottlieb, 1946).

In the past few years interest has been focused on the importance of smoking as a cause of carcinoma of the bronchus. The recorded mortality from this tumour in England and Wales increased fifteenfold between 1922 and 1947; it is now probably the commonest form of malignant disease met by the general physician. This increase has been noted in all countries of the Western World, with the exception of Iceland (Dungal, 1950); records show that bronchial carcinoma provides 27% of all malignant tumours in the post-mortem rooms of London (Bryson and Spencer, 1951) but only 2.9% in those of Reykjavik (Dungal, 1950). Cigarette-smoking has long been suspected as a cause, and some recent statistical investigations have proved this suspicion true. It is of interest, moreover, that the cigarette consumption in Iceland has been negligible until the last few years. In a series of 684 patients with bronchial carcinoma in the United States, only 1.3% were non-smokers and 51.2% had smoked more than 20 cigarettes a day for 20 years; the figures for these classes in the general hospital population without cancer were 14.6% and 19.1% (Wynder and Graham, 1950). Independent observations made in this country have led to the conclusion that after the age of 45 years those who smoke 25 or more cigarettes a day are fifty times more likely to develop carcinoma of the bronchus than non-smokers of the same age. No such correlation with pipe-smoking could be found (Doll and Hill, 1950).

The only known carcinogen in cigarette smoke is arsenic, but there is not enough evidence to inculcate it. It seems clear that some cause other than, or additional to, the increase in cigarette consumption must be sought to explain the increasing frequency of bronchial carcinoma, because the second has risen more rapidly than the first. It is difficult, moreover, to understand why there has been no parallel rise in the incidence of cancer of the upper respiratory tract, although carcinoma of the larynx and pharynx is significantly more frequent in smokers than in non-smokers (Schrek, Baker, Ballard, and Dolgoff, 1950).

The moral we should draw is obscure: perhaps we should caution all young men and women not to smoke more than 20 cigarettes a day. The popular reaction is illustrated by the subscriber to the *Readers' Digest* who was so upset by an article on smoking and cancer that he decided to give up reading magazines.

Its Effect upon the Alimentary Tract

To turn now to the alimentary tract: there is good reason for thinking that cancer of the lip is commoner in pipe and cigar smokers than in the general population, but this predisposition does not extend to cigarette smokers (Levin, Goldstein, and Gerhardt, 1950). Presumably local irritation must be held responsible.

The effect of smoking upon the stomach is of importance, because it has long been traditional to urge the patient with peptic ulcer to abstain. Smoking one cigarette has been shown to diminish hunger contractions and gastric motility as well as to decrease the volume and acidity of gastric secretion; in only one of twenty patients was there an increase in acidity. These effects are probably reflex, because they do not occur after injection of nicotine in dogs (Schnedorf and Ivy, 1939; Ivy, Grossman, and Bachrach, 1950). Wolf and Wolff (1943) were able to watch the behaviour of the stomach in their patient Tom, who had had a large gastric fistula for over forty years. When smoking was pleasurable no change took place in the gastric contractions, vascularity, or acid secretion; when he had no taste for it a cigarette induced slight nausea, contractions ceased, the mucosa became pale, and acid secretion failed; these changes were common to the sensation of nausea however evoked. The increase in appetite, which many who renounce smoking notice, may be due to the removal of the inhibitory influence of tobacco on gastric motility.

These physiological observations provide no theoretical justification for advising the patient with peptic ulcer to stop smoking, yet many physicians are convinced that tobacco has a deleterious effect on this disease. It is always said that the patient with peptic ulcer is a heavy smoker (Hurst and Stewart, 1929; Bockus, 1944), but in a careful survey it was found that men with chronic duodenal ulcer do not smoke, on an average, more than healthy men of the same age, although twice as many of them inhale (Trowell, 1934). Many experienced clinicians have noted dyspepsia, resembling that of ulcer, to disappear on abstinence from tobacco (Wagner, 1924; Bockus, 1944; Schindler, 1947). On the other hand, a careful follow-up of a group of patients with peptic ulcer (Jamieson, Illingworth, and Scott, 1946) revealed no correlation between alterations in tobacco consumption and variations in the severity of symptoms. Some figures suggest that the response to treatment with antacids is better if smoking is discontinued (Batterman and Ehrenfeld, 1949).

It seems fair to conclude that smoking plays no part in the genesis of peptic ulcer. That notoriously dangerous guide, "clinical impression," has led many to believe that it may aggravate symptoms. The sensible advice is to recommend patients to try a period of abstinence and decide for themselves whether they are better without their cigarettes.

There is some gastroscopic evidence that smoking may lead to changes in the gastric mucosa. In one series the appearances were normal in only 8% of heavy smokers, there was hypotrophic gastritis in 44%, and atrophic gastritis in a like proportion (Annis, 1944).

Cigarette-smoking has been observed to increase the motility of the large bowel in normal subjects (Schnedorf and Ivy, 1939), and this finding provides a physiological justification for Ryle's view (1928) that it is of importance in the causation of spastic colon. A period of abstinence is worth a trial in this disorder.

Its Effect upon the Nervous System

Many curious nervous disorders have been attributed to the use of tobacco. The French journals, in particular, contain numerous case reports: an officer's wife, afflicted with vertigo and signs of pyramidal tract disease, who recovered in two weeks after renouncing the 25 cigarettes she had smoked daily for fifteen years (Barré and Verdier, 1949); a myasthenic and polyneuritic syndrome in chewers of tobacco (Coulonjou, Prévot, Salaun, and Nicolet, 1946); a boy of 13 years who fell victim to the manic-depressive psychosis after smoking 20 cigars a day (Pel, 1911). These instances could be multiplied indefinitely; there are records of fleeting cerebral attacks, of neuralgic pains, of headaches, of fits, all lending support to Calverley's contention of

How they who use fuses
All grow by slow degrees,
Brainless as chimpanzees,
Meagre as lizards;
Go mad, and beat their wives;
Plunge (after shocking lives)
Razors and carving knives
Into their gizzards.

There was, however, one condition in which the role of tobacco seemed to be authentic. This was tobacco amblyopia, a disturbance of vision occurring chiefly in men between the ages of 35 and 55 years, starting as a paracentral scotoma for colours at the blind spot and gradually spreading to the point of central vision (Wilson, 1940). It was said to afflict particularly those who smoked strong shag (Moore, 1925). It was more common in the United Kingdom than in France or the United States, where alcohol had long been regarded at least as important as tobacco in its cause (Walsh, 1947). In one American series of 1,100 patients over the age of 50 years with this form of amblyopia, the average consumption of tobacco was less than in 500 healthy persons of the same age (Usher, 1927).

A correlation between malnutrition and the incidence of tobacco amblyopia has long been noted; de Wecker (Schepens, 1946) commented on its frequency during the siege of Paris in 1870, and a tenfold increase was observed under the German occupation of Belgium between 1940 and 1945. Carroll (1944) has reported complete or partial recovery in 25 patients with what he terms "tobacco-alcohol amblyopia" when their diets were supplemented with the vitamin-B complex or vitamin B₁ itself, although they continued to smoke and drink.

In this country alcohol lacks the importance accorded to it elsewhere (Evans, 1939), and tobacco is generally believed to be the essential cause, although malnutrition is allowed a predisposing role. The suggestion has been made that some unknown toxic substance is formed by fermentation in the heavier and darker tobaccos; this substance is rendered harmless by the healthy liver, but, when malnutrition impairs hepatic function, detoxication fails and the retina suffers (Evans, 1939; Schepens, 1946).

The similarity between amblyopia attributed to tobacco and that noted in malnourished prisoners of war (Denny-Brown, 1947) is obvious, but the resemblance is not exact. Proof that "tobacco" amblyopia is purely of nutritional origin is still lacking, and it remains wise to recommend patients with the complaint to abstain from smoking.

Its Effects upon the Genito-urinary System

The effects of tobacco on the genito-urinary system are not of great moment. In the normal man it has an anti-diuretic action (Burn, Truelove, and Burn, 1945), due to nicotine provoking liberation of the antidiuretic hormone (Cates and Garrod, 1951). It was at one time believed to decrease libido and a Franciscan monk, Fra Giuseppe da Convertino, recommended it from personal experience as a safeguard for chastity. In more recent years it has been said to lead to abortion and infertility (Mgalobeli, 1931), although another authority asserts that he had found a group of pipe-smoking Frenchwomen, whose habits he had studied, to be of exceptional fertility (Chiasson, 1929).

It has been proved that nicotine is secreted in the milk in proportion to the number of cigarettes smoked; in heavy smokers the quantity may rise to 0.5 mg. per litre. Infants fed on this milk thrived normally, although they must have received 0.1-0.25 mg. of nicotine a day (Perlman and Dannenberg, 1942).

Conclusion

The public library in New York is said to contain more than 4,000 books on tobacco in more than 20 languages (Bishop, 1949). It will be appreciated, therefore, that a short paper can only touch the fringe of the subject. It is, however, a matter which closely concerns us as doctors, for patients are constantly asking our advice about smoking. Most of us are prepared to give it without deep reflection, for the view the doctor takes is dictated rather by the number of cigarettes he smokes himself than by a profound knowledge of the pharmacology of tobacco. It is, however, well to remember that some facts have now been established, and it should no longer be said that those of us who are heavy smokers impose no restrictions, while the non-smokers

Compound for sins they are inclined to
By damning those they have no mind to.

During recent years industry has paid increasing attention to colour coding of danger points in factories to indicate high voltage lines, toxic gases, and obstructions such as low doorways and steps; the British Standards Institution considered the possibility of preparing a uniform "safety" colour code. However, following an inquiry by the Royal Society for the Prevention of Accidents it has now been decided to abandon the idea. Examination showed that a distinction must be made between a safety colour code and an identification code—the one being broadly to classify and give warning of types of hazard by colour and the other primarily to identify the contents of cylinders and so on. It was found that many colours had traditional meanings which were not reconcilable with their identification value—for instance, green CO₂ containers are not consistent with the concept of red for danger. Also, since anything up to 8% of the population is thought to be to some degree colour-blind, the application of a colour system can in no way be universally effective.

RETROLENTAL FIBROPLASIA

A PROBLEM OF PREMATUREITY

BY

B. A. BEMBRIDGE, M.B., Ch.B., D.O.M.S.

M. COXON, M.B., D.C.H.

AND

V. SMALLPEICE, M.D., M.R.C.P.

(From the Department of Paediatrics, Radcliffe Infirmary; Oxford Eye Hospital; and Nuffield Laboratory of Ophthalmology, Oxford)

Retrolental fibroplasia may lead to blindness in infancy, and it is the gravity of this possible outcome that makes its study so urgent a problem. The disease has been the subject of a large number of papers in the American literature since Terry's first report (1942), in which he recognized it as a condition occurring in premature babies, leading to the formation of an opaque vascularized membrane behind the lens of both eyes, usually with gross visual defect and searching nystagmus. The subject has as yet received little attention in the medical press of this country, but there is reason to believe that the disease is making its appearance here in the same curiously uneven and unpredictable manner as in the United States and, more recently, in other countries.

A team drawn from the Oxford Eye Hospital, the paediatric department of the United Oxford Hospitals, and the Nuffield Laboratory of Ophthalmology has been concerned in a joint investigation since June, 1950.

Diagnosis of Cases

Early in 1950 we started routine ophthalmic examination of all premature babies of low birth weight born in Oxford, in the hope that some clue to the nature of the disease might be gained from observation of the condition as it developed, and later because of the possibility of treatment.

It is unlikely that retrolental fibroplasia occurs in infants weighing over 5 lb. (2.3 kg.) at birth, so this was our dividing line. All infants weighing 5 lb. (2.3 kg.) and under at birth are examined at the discretion of the paediatricians, larger and healthier children within a few days of birth, and small weakly babies, unable at first to tolerate the handling involved in an ophthalmic examination, after several weeks. After the first examination infants are seen every week while in hospital. They are usually discharged on reaching a weight of 5 lb. (2.3 kg.) and are then followed up at special clinics at the Eye Hospital. Generally a baby will be seen fortnightly until it is between 3 and 4 months old, and then monthly until 6 months of age, when it is discharged from supervision if no signs of the disease have appeared. If any suspicious feature is seen in the eyes, particularly retinal vascular dilatation of marked degree, the infant may be examined at shorter intervals.

The examinations are all made by an ophthalmologist, and the infant is held by a nurse experienced in this work. General anaesthesia is unnecessary, though a comforter is invaluable. The pupils are dilated with

homatropine 1% combined with cocaine 2% instilled into the eyes half to one hour before examination, and repeated if necessary. It is almost always possible to see far out to the retinal periphery; on two occasions only have we found it necessary to steady the eye with conjunctival fixation forceps, after using a drop of local analgesic.

There are certain differences between the ophthalmological appearances of the infantile and the adult eye. Unless these are appreciated confusion is likely. The infantile optic disk is always extraordinarily pale and the central fundus often has a patchy distribution of pigment. The retinal periphery constantly has a peculiar oedematous-looking greyness, gradually merging into the pinkness of the posterior fundus. These appearances have been seen in both full-term and premature babies, and they gradually disappear during the first weeks of life.

Early diagnosis of the disease is not easy. Many of the preliminary stages seem to develop gradually from conditions which are apparently normal in the infant. The grey zones in the retinal periphery appear to be a constant feature of the infantile eye. Only observation week by week, or even from day to day, makes it possible to be sure that this appearance is normal and not increasing.

The periphery of the infant lens is often doubly refractile, and this may lead one to suspect a detachment of the retina when in fact there is none. We are sure that diagnosis of the disease cannot be made without the presence of a retinal detachment or thickening, or of some retrolental mass near the periphery. In addition to these signs engorgement of the retinal vessels and formation of "fans" of new vessels from the retinal vessels, often coming forward into the vitreous in front of the thickened or detached retina, are important diagnostic points. We do not regard retinal vascular dilatation alone as sufficient to warrant a diagnosis of retrolental fibroplasia.

Treatment with A.C.T.H.

Reports of the results of treatment with A.C.T.H. and cortisone show no general agreement. The small number of cases in the series treated and the unpredictable course of the disease make evaluation of treatment difficult. The organization of vitreous opacities is probably responsible for the final cicatricial changes, and it is in preventing the formation of this fibrous tissue that A.C.T.H. may be expected to exert its effects. In Woods's (1950, 1951) experience with 10 treated cases, the results of the use of A.C.T.H. were unfavourable. Fitzgerald *et al.* (1951) treated three cases with A.C.T.H., with unfavourable results, and three cases, in the late glaucomatous stage of the disease, with cortisone locally, with results of doubtful significance. On the other hand, the experience of Reese and Blodi (1951a) has encouraged them to continue the use of A.C.T.H. In 14 of their treated cases the disease either regressed or was arrested, while the disease progressed in six out of the eight untreated cases under their care during the same period. Scheie *et al.* (1951) treated five cases, and concluded that treatment with A.C.T.H. is worth further trial.

In a personal communication from Dr. Perera and Dr. Day, of New York, in November, 1950, we learned of their early experience with A.C.T.H. We were fortunate in obtaining a supply of the drug for treatment of a case in December, 1950. Since then five further cases have been treated.

We gave A.C.T.H. by intramuscular injection to the six cases in four doses daily, totalling 20–25 mg. When re-

actions caused anxiety, each dose was divided and given in two parts with a 10-minute interval. In three cases the drug was discontinued temporarily when the baby's condition was unsatisfactory, and treatment was restarted without causing any further ill effects. When the ophthalmologist considered the disease to be quiescent the dose was usually halved for two or three days before discontinuing treatment. The infant was then kept in hospital for a further period of at least eight days under the closest supervision, and subsequently followed up in the out-patient department. In no case has there been any relapse after discharge from the ward.

In our first case we were afraid of the possibility of relapse with rapid development of blindness on stopping the drug, and continued it very much longer than we would now consider necessary, giving a total of 1,025 mg. over 76 days. In the other five cases the duration of treatment varied from 22 to 39 days and the total dosage of A.C.T.H. was 300 to 620 mg.

Complications Arising During Treatment

Intercurrent Illness.—Hospitalization of these small premature infants is a serious responsibility, and strict barrier nursing in isolation cubicles is essential if they are to be treated in a children's ward. Three babies remained well throughout treatment, and the other three were ill at some time.

Immediate Reactions.—Transitory blanching of the infant may occur within one or two minutes of the injection, the condition passing off in less than 10 minutes.

Hypertension.—There has been moderate or severe hypertension in five of the six cases treated, and the systolic pressure has been extremely labile. The degree of hypertension has not followed the dose of A.C.T.H. closely, and in cases in which the drug has been stopped temporarily the hypertension has not necessarily returned on resuming the original dose. In three cases the pressure has reached 180–200 mm. Hg, and in two it has risen to 280–300 mm. Hg, on one or two occasions without any apparent change in the infant's condition. Hypertension is presumably due to impurities in the A.C.T.H., but we have not found it vary with the batch of drug in use. Our colleagues in New York had not mentioned it as a complication. We found some consolation in the fact that the infant's vessels are elastic and in the well-recognized observation that the small infant with pink disease can support a moderate degree of hypertension for several months with no apparent after-effects. Since treatment was stopped the blood pressure in all cases has returned to normal.

FIG. 1.—Records of A.C.T.H. dosage, eosinophil count, blood pressure, and weight in Case 4.

Electrolyte Balance.—As Dr. Day led us to expect, we have had remarkably little trouble and have not been able to ascribe any symptoms to changes in the electrolyte balance. In our first case blood was taken at frequent intervals for sodium and potassium estimation, but this was abandoned as causing unnecessary trauma. In subsequent cases we have relied upon electrocardiograms taken at weekly intervals. When the E.C.G. suggested a potassium deficiency we have given potassium in the form of potassium chloride, 0.5 g. daily in four divided doses by mouth.

Weight.—A rapid gain in weight may indicate water retention, but in only one of our cases did a transitory retention seem likely. Several infants gained little during treatment and rapidly improved immediately the drug was discontinued. The only infant who made a very satisfactory gain throughout was the one in whom hypertension never developed. In no case have we as yet encountered any complication which has persisted after treatment has been discontinued. Fig. 1 shows A.C.T.H. dosage in detail and its effect on the eosinophil count, blood pressure, and weight in one of our cases.

Case Histories

Case 1.—A boy, weighing 3 lb. 2½ oz. (1.4 kg.) at birth, was the first child of a 38-year-old mother who had severe toxæmia of pregnancy superimposed on chronic renal disease. Delivery was by caesarean section at 37 weeks. When the child was 2 months old many small retinal haemorrhages were seen. At 3 months there were retinal detachments in both nasal and temporal quadrants of the right eye, with new-vessel formation on the surface of the retina, and a vitreous opacity in front of this. The left eye seemed normal. During the next few days the condition of the right eye worsened rapidly and the baby was admitted to hospital for treatment with A.C.T.H. Next day the left eye showed an early detachment of the retina, and this progressed despite treatment. The right eye developed bands, or folds, in front of the detached retina, somewhat similar to the appearance of retinitis proliferans. Eventually the right retina became completely detached and a dense retro-lental membrane developed. The left eye showed a grey mass of retina in the temporal quadrant, with a vitreous veil in front of it. There was nystagmus and the child did not follow a light. As the condition in the left eye seemed stationary, treatment was stopped after 76 days. We now consider this period too long, and it has been reduced in later cases. Six months after treatment ended the condition was unchanged, though the anterior chamber in the right eye was shallow. Nystagmus was less marked and the child picked up small objects, had a useful visual field, and was developing normally.

Case 2.—A girl, one of non-identical twins, the other child being normal, was born by spontaneous labour at the 33rd week and weighed 3 lb. 10 oz. (1.6 kg.). The neonatal period was complicated by bronchopneumonia, which responded to penicillin and streptomycin. At 6 weeks of age retrolental fibroplasia was diagnosed. Both eyes showed gross arterial and venous dilatation spreading out to the periphery, with many visible capillaries and a few small haemorrhages, and there was a retinal detachment on the left. Treatment by subconjunctival and oral administration of cortisone was tried. After a week of this treatment, when the child had received 1.5 mg. cortisone by injection and 150 mg. by mouth, the retinal condition showed no sign of diminishing activity and the right eye developed a peripheral detachment. A.C.T.H. was then substituted for cortisone. At this time there was gross vascular engorgement in each eye, with a few small retinal haemorrhages and peripheral detachments of the retinae. These vascular changes were more marked in the left eye. Vitreous opacities appeared in the right eye. When the stage of active vascular dilatation was over, a retinal fold developed, running from the retinal detachment to the optic disk and obliterating the right macular region. The retina in the left eye became completely detached. When the child was seen

at 9 months of age the left eye showed a complete retrolental membrane, and the right eye a retinal fold, but the child takes an interest in her surroundings and can see small objects.

Case 3.—A girl, birth weight 4 lb. 6½ oz. (2 kg.), 33 weeks' gestation. The mother had severe toxæmia a week before the child was born after induction of labour. At 3 weeks of age the child was found to have engorged retinal vessels, but the peripheral grey areas were within normal limits. At 5 weeks a small detachment had appeared in the right eye and treatment with A.C.T.H. was begun. Within the next 10 days, despite treatment, the detachment had become more definite in the right eye and there were signs of activity in the left. The vascular engorgement lessened and the detachment did not increase after the child was 8 weeks old. Treatment was stopped, and the ocular condition has remained unchanged. When the child was 8 months old the central fundi of both eyes were normal; in the left eye there was marked greyiness in the temporal periphery. She has good vision.

Case 4.—A boy, birth weight 3 lb. 15 oz. (1.8 kg.), gestation 36 weeks, labour spontaneous. A diagnosis of retrolental fibroplasia was made when the child was 6 weeks old because of a typical vitreous opacity and dilated vessels, with an apparent retinal detachment, in the temporal half of the right eye. Treatment was begun and for the next few days no change occurred. At 8 weeks of age a tongue of vitreous haze was seen on the extreme nasal side of the right eye and there was vascular dilatation behind this. In the left eye there was increased tortuosity of vessels and new-vessel formation on the edge of the temporal grey zone. At 9 weeks there seemed to be a definite detachment behind the vitreous haze in the right eye, whilst the left eye had a suspicious area in the inferior quadrant of the globe. There was no nystagmus, and the child seemed to follow a light. At 11 weeks all that could be seen to be abnormal was a small tongue of detached retina in the extreme nasal periphery in the right eye, whilst in the left there was no detachment or dilated vessels. Treatment was stopped when the child was 13 weeks old, as there had been no further changes in the retinae for the previous few days. The vitreous opacity in the right eye has remained much as it was, but the retinal detachment seemed to have become less. The changes in the periphery of the left eye consisted of the presence of a large grey zone in the retina. When 9 months old the child could obviously see well; in the right eye the detachment was still present but flat, and no gross abnormality was seen in the left eye.

Case 5.—A boy, birth weight 3 lb. 4 oz. (1.5 kg.). His mother was a primipara aged 17; she had toxæmia of pregnancy, and surgical induction was performed for this; normal labour followed. An upper respiratory infection in the child was treated by chemotherapy. At 5 weeks the upper temporal vessels were dilated and tortuous in the left eye and many vessels were dilated at the edge of the grey zone; at least one haemorrhage was seen. The right eye showed similar but less obvious changes. Three days later a detachment in the left temporal periphery could be seen and the grey zones of the right eye had become more extensive. Because of these changes a diagnosis of retrolental fibroplasia was made and treatment with A.C.T.H. begun. The condition remained active in both eyes and a vitreous haze appeared, partly hiding the detachment in the right eye; the detachment in the left eye became more extensive and the vessels very dilated; there was a fresh haemorrhage in the right eye. Two weeks later the disease appeared stationary. A curious feature observed at this stage was a red patch in the middle of the detached area; this appeared to be a hole through which one could see the choroid. In another week the vasodilatation had disappeared and treatment was stopped. When last seen (at 13 weeks old) no further change had taken place, but the retinal detachments were flatter. The central areas appeared to be normal. At 7 months scarring was present in the

peripheral retinae of both eyes, and the left eye was probably becoming myopic. The child takes an interest in his surroundings and picks up objects.

Case 6.—A girl, birth weight 2 lb. 6 oz. (1.1 kg.); born by caesarean section. Apart from a scalp laceration during the operation and an attack of vomiting and abdominal distension which responded to chemotherapy, the neonatal period was uneventful. At 10 weeks, on routine ophthalmological examination it was noticed that there was vasodilatation, more marked on the following day, and that a shallow retinal detachment was present in the periphery of both eyes. The infant was given A.C.T.H. for 10 days. The disease made no further progress and the detachments became flatter. She has been examined several times since, and, apart from a shallow retinal detachment or thickening in the periphery of the upper temporal quadrant of the right eye, the eyes appeared normal; there was a large grey zone in the left eye, but no detachment. When 10 months old this child proved difficult to examine, but both fundi appeared to be within normal limits, and the child could see well.

Comment on Untreated and Treated Cases

Untreated Cases.—The early cases were all in a late stage of the disease when first seen. In one of them the process had apparently been confined to one eye, but in 15 it was bilateral. The degree of visual defect varied. In those children in whom there was a complete retrolental membrane with total detachment of the retina, gross nystagmus was present and there was no perception of light. In others, useful vision has been retained, despite the presence of peripheral retinal detachment. Such vision as has been retained is not commonly central, but is adequate to enable the child to avoid obstacles. On the other hand, central visual acuity may be good. This frequent preservation of useful vision makes it essential that these eyes should not be removed simply in order to confirm the diagnosis. The clinical picture, taken in conjunction with the history, is characteristic.

A further six cases were seen early enough to permit A.C.T.H. treatment, and they are described in some detail below.

Cases 1 and 2 had a florid active type of the disease, which we should have expected to proceed to the full development of retrolental membrane and complete retinal detachments in both eyes. Our impression was that after treatment the disease was arrested at an earlier stage than would have been expected without treatment. We are aware, however, that this is often a self-limiting disease, and have seen two untreated cases in which one eye did not develop the disease to the full extent.

Cases 3, 4, 5, and 6 were diagnosed earlier than the first two, and treatment started immediately. The disease settled fairly quickly, and after the eyes became quiet no further deterioration occurred. It may be that we were dealing with a milder form of the disease, as variation in the severity is known to occur, but it is a fact that these cases showed fairly steady improvement after the use of A.C.T.H.

Though no definite conclusion can be drawn from this small series, the following comparison can be made between the results of the disease in babies born during the year preceding the use of A.C.T.H. and the results of treatment with A.C.T.H. In the former group three children were totally blind; three were partially blind, retaining sufficient vision to avoid large objects; and another child, who has now left this area, is expected to have good vision in one eye. In the latter group only two complete retrolental membranes developed, and no child was totally blind.

Pathology

We agree with those (Reese, 1948; Kinsey and Zacharias, 1949) who believe that the increased incidence of retrolental fibroplasia cannot be completely explained by the recent improvement in survival rate among infants of low

birth weight. Confusion has been caused by the suggestion that we may be dealing, not with one disease, but with several, the final result of each of which is the formation of opaque tissue behind the lens. Another possibility is that the disease itself is changing in character, for the description by Terry (1948) differs widely from more recent ones (Owens and Owens, 1949; Hepner, Krause, and Davis, 1949; Reese and Blodi, 1951a).

Vascular Basis

Terry (1948) described the first evidence of the disease as a dot-like opacity occurring behind the lens and spreading outwards towards the periphery. This spread, in Terry's view, is associated with a reopening of the hyaloid vessels and consequent vascularization of the retrolental membrane.

The hyaloid vessels were also thought to be involved in the disease by Reese and Payne (1946), who described cases

FIG. 2.—Fibrovascular connective tissue membrane behind lens. Complete retinal detachment extending beyond ora serrata. Subretinal exudate.

of "hyperplasia of the primary vitreous with persistence of the tunica vasculosa lentis." These authors considered the condition to occur antenatally in either premature or full-term babies. They also state that the retina in these eyes may or may not be in position. This does not agree with our experience and that of many others, in which the condition of retrolental fibroplasia as it now occurs is of post-natal development and associated, in the fully developed case, with a totally detached retina; these eyes are ophthalmoscopically normal at birth and for a variable period afterwards. Unsworth (1948) also concluded that the disease was post-natal and suggested that the anaemia of prematurity was the cause. Reese (1949) and Klien (1949) reported further cases, reiterating their belief that the matrix of the disease was present at birth and angiomatic in nature.

Lately the part the retinal vessels themselves play in the development of the disease has been increasingly stressed, and our experience supports this change of emphasis. Owens and Owens (1949) and Reese and Blodi (1951a) have described the early stages of the disease as characterized by vascular dilatation on the retina, exudation into the vitreous, and the development of a peripheral detachment of the retina. Others (Laopus and Bousquet, 1951) regard the

occurrence of retinal haemorrhages as an essential part of the picture, but these have occurred in only a few of our cases. Reese and Blodi (1951a) have convincingly shown the early involvement of the retinal vessels in the disease process.

It is possible that an exudative choroido-retinitis causes a retinal detachment, which sets up a cyclitis with the formation of a retrolental membrane (Fig. 2). The retinal detachment may be due to a developmental defect (Wolff, 1950; Dixon and Paul, 1951). These authors have put forward evidence that a retinal separation has occurred in the pars ciliaris retinae of eyes in which the disease develops.

Associated Abnormalities.—Whether or not retrolental fibroplasia represents a generalized abnormality of neuro-ectodermal structures is a question which still remains to be answered. Krause (1946) was convinced that this was so and that the ocular changes were merely a part of what he called "encephalo-ophthalmic dysplasia" which led to mental retardation as well as gross visual defect.

It is difficult to assess the mental development of a very young child handicapped by blindness, but mental abnormality in these children has not been stressed by most writers. In some of our cases mental development has been slow, but we feel it is too early yet to assess the ultimate intellectual capacity of the children.

Sex Incidence and Multiple Births.—Speert, Blodi, and Reese (1950) analysed a series of 104 cases and found the sex incidence approximately equal. In Oxford 9 out of 22 cases were twins, but Kinsey and Zacharias (1949), in their larger series, could find no correlation between multiple births and the incidence of retrolental fibroplasia.

Antenatal and Post-natal Factors

American workers have concluded that the mother's age, race, parity, and rhesus group are not related to the development of the disease. There is no evidence that toxæmia of pregnancy, antenatal bleeding, drugs used in pregnancy or labour, or the cause of the premature labour are significant. It has not been possible to correlate the incidence of any chronic disease in the mother with the development of retrolental fibroplasia. Speert, Blodi, and Reese (1950) report two cases in which the disease had followed maternal rubella in the first three months of pregnancy, but no other known bacteria or virus has been implicated.

One of the first post-natal factors to be investigated was the effect of light on the immature retina. Hepner, Krause, and David (1949) covered the eyes of five babies weighing 3 lb. (1.4 kg.) or under at birth, for up to 60 days of life. Four babies developed retrolental fibroplasia, while the fifth remained normal.

Owens and Owens (1949) state that vitamin E is deficient in the newborn rat, and that the deficiency might be enhanced by a reduced fat diet and by the administration of vitamin A and iron. They gave 150 mg. of α -tocopherol acetate orally each day, and reduced amounts of vitamin A and iron, to 23 infants of 3 lb. (1.4 kg.) or less at birth. Of these, only one baby developed retrolental fibroplasia. In a control series of 78 infants of 3 lb. (1.4 kg.) or less, 17 babies developed the disease. In nine early cases vitamin E was given and the lesion was arrested in five of them. Unfortunately this work has not been confirmed. In Oxford during 1950-1 five infants developed retrolental fibroplasia while having vitamin E in the form and dosage suggested by Owens and Owens.

No known post-natal infections play a part in the aetiology of retrolental fibroplasia, but it is possible that some unknown infective agent may be responsible.

In looking for a recent change in treatment which might be held responsible, oxygen was considered, for modern oxygen cots and tents permit a very high concentration of the gas. Kinsey and Zacharias (1949) found that babies developing retrolental fibroplasia had been treated for a

significantly longer period in oxygen than those who remained normal. Campbell (1951) found a significantly higher number of cases in a hospital where oxygen was freely used than in a second hospital where the use of oxygen was limited. It is doubtful, however, whether the two series are comparable. One baby in our series who had received no oxygen developed the disease, and in other centres where oxygen is used freely no cases have occurred. The importance, if any, of delayed feeding in the handling of small babies is obscure.

Incidence

Retrolental fibroplasia was reported in the United States 10 years ago, but so far as can be assessed it has appeared in England more recently. Reese and Blodi (1951b) report 272 cases studied at the Institute of Ophthalmology in New York; 236 of these were diagnosed during and after 1944. In Boston also the increase has been considerable. The disease is unevenly distributed amongst the various American centres. Exline and Harrington (1951), from New Orleans, report 80 infants under 3 lb. 5 oz. (1.5 kg.) at birth over a two-year period ending December, 1948, amongst whom no case of retrolental fibroplasia was found: 80% of these children were negroes.

From Paris, Lelong (1951) reported 44 cases during the period 1948-50. Campbell (1951) reported 27 cases from Melbourne. In England the first cases were reported by Martin and Franklin (1949), Moffatt (1950), Crosse (1950), and Minton and Cole (1951). It is known that cases are being diagnosed in other centres in England and that the number of cases is increasing.

In Oxford eight cases were diagnosed in 1949, representing 3.8% of surviving premature babies. In 1950 there were five new cases, and up to the end of June, 1951, four babies had developed the disease.

During 1950, Dr. Alison Webb, of the Children's Department, investigated the causes of blindness among pre-school-children in Oxfordshire, Berkshire, and Buckinghamshire. Although the numbers are very small, in 1950 retrolental fibroplasia was the largest single cause of blindness among these children.

An attempt was made to examine all babies weighing 4 lb. (1.8 kg.) or under at birth born or treated in the Oxford hospitals over the period from 1946-50. Of these children, 88% were traced and no signs of the disease were found in these.

Summary

Retrolental fibroplasia is a disease of recent appearance in Great Britain. It is confined to premature infants of low birth weight, is of post-natal appearance, and may lead to gross visual defect or blindness of both eyes.

Since 1947, 22 cases have appeared in Oxford. Their diagnosis is discussed.

The method, results, and side-effects of treatment of six cases with A.C.T.H. are given. It is considered that the disease was restrained by this treatment.

Despite gross intraocular damage, many of the eyes retain sufficient vision to enable the child to avoid obstacles and to walk about unaided. Excision of the eye is unnecessary, and is to be avoided in view of this possibility.

The aetiology and pathology of the disease are briefly discussed. Its cause remains unknown.

We should like to thank Mr. J. P. F. Lloyd and Mr. Victor Purvis, of Oxford, and Mr. R. C. Williams, of Aylesbury, for permission to publish the details of some of these cases; also the obstetricians of the United Oxford Hospitals for their constant and ready help, and Mrs. A. Pirie for advice. Our thanks are also due to the sisters and nursing staff of the United Oxford

Hospitals for their assistance in the examination and treatment of the children, and to Miss M. Hutchinson for considerable secretarial help.

DEPRESSION OF TUBERCULIN SENSITIVITY IN GUINEA-PIGS BY CERTAIN ANTITUBERCULOUS SURFACE-ACTIVE AGENTS

BY

P. D'ARCY HART, M.D., F.R.C.P.

D. A. LONG, M.D.

AND

R. J. W. REES, M.B., B.Sc.

(From the National Institute for Medical Research, Mill Hill,
London, N.W.7)

Substances known to depress skin sensitivity to tuberculin are few in number (Long and Miles, 1950; Fisher, Harrington, and Long, 1951; Long, Miles, and Perry, 1951c), and when such depression is associated with anti-tuberculous action the question arises whether the chemotherapeutic mechanism is the same as, or is allied to, the anti-allergic.

The development of experimental tuberculosis in mice was shown by Cornforth, Hart, Rees, and Stock (1951) to be markedly inhibited by the injection of non-ionic, water-soluble, surface-active polyoxyethylene ethers of

$n=0, 1, 2, 3$, and higher integers. $x=10, 20$, or 60 (average value).

low toxicity, having the general formula given here, and obtained by polymerization of ethylene oxide with condensation products of formaldehyde with *p*-tert-octyl phenol. The antituberculous effect of these detergents

has since been confirmed in the guinea-pig, in which a substantial curative action was shown in an established (three-weeks-old) infection. Routine quantitative tuberculin tests made at the end of a 60-day course of treatment showed a marked reduction in hypersensitivity in the detergent-treated animals as compared with their controls. The desensitization appeared to be specific rather than due merely to suppression of tuberculosis, since it was more evident than in a parallel group of streptomycin-treated animals with somewhat greater suppression of disease. This unexpected observation has led us to a more precise study of the depression of tuberculin sensitivity by these agents in B.C.G.-sensitized guinea-pigs, using the method of Long and Miles (1950). We hoped to see whether this action resembled that of other substances known to diminish tuberculin allergy, and whether it was related to antituberculous activity.

Materials and Methods

Surface-active Agents.—Representative members of the series (see formula) were used (average of 20 units of ethylene oxide per phenolic nucleus, unless otherwise stated). These were D2, a mixture of compounds having various values of n from 0 upwards; D2a, a similar mixture but with a smaller proportion of the lower members of the series; D9a, an isolate with $n=1$ ("triplet"); D14, a mixture like D2 but with 10 units of ethylene oxide per phenolic nucleus, and therefore less hydrophilic; D22, a mixture like D2 but with an average of 60 units of ethylene oxide per phenolic nucleus, and therefore more hydrophilic. Compounds D2, D2a, and D14 were chemotherapeutically active in the tuberculous mouse; D9a and D22 were inactive. The compounds were synthesized by our colleagues, Dr. J. W. Cornforth and Mr. J. A. Stock. They were given intravenously in 0.5 ml., or subcutaneously in 1 ml., saline.

Cortisone was given as the acetate (Merck), subcutaneously in 1 ml. normal saline.

Guinea-pigs.—The Hampstead strain of albinos was used. The animals weighing about 350 g. They were fed on a pelleted diet (Bruce and Parkes, 1947) supplemented, unless otherwise stated, with unlimited cabbage. B.C.G.-sensitization was carried out as described by Long and Miles (1950).

Tuberculin Sensitivity.—This was tested by intracutaneous injections of 32 and 320 international units of O.T. in 0.2 ml. saline.

Effect on Tuberculin Sensitivity

The intravenous route was considered most likely to reveal any differences between the surface-active agents, since variations in absorption would be excluded. Intravenous injection of the chemotherapeutically active preparations D2, D2a, and D14 in doses of 10 mg. in the B.C.G.-sensitized guinea-pigs, immediately before tuberculin injections, produced a significant though limited diminution of sensitivity as compared with untreated sensitized controls; the diminution was of the same order as that produced by cortisone 2 mg. given subcutaneously six hours before the tuberculin. On the other hand, the chemotherapeutically inactive D9a and D22 were without appreciable effect in these intravenous doses, and even at 25 mg. (this dose, in the case of D22, being chosen so as to contain the same weight of phenolic nuclei as 10 mg. of D2—see above).

The desensitizing properties of D2a were further examined, choosing the more convenient subcutaneous route, injections being given in groups of ten B.C.G.-sensitized guinea-pigs two hours before the tuberculin. Under these conditions D2a gave its maximal effect on tuberculin depression, in comparison with the controls, at doses of 100 to 10 mg., there being no significant difference from the effect of cortisone 2 mg.; D2a had no effect at 1 mg.

Cortisone has no direct effect on tuberculin allergy; its desensitizing action depends on dietary factors (Long, Miles,

TABLE I.—Comparison of the Effect in Individual Treatment Groups with that in the Control Group (Same Experiment as Illustrated in Chart)

§ When cortisone was used instead of D2a the effect was significant.

and Perry, 1951a). It does not desensitize in guinea-pigs fed upon an ascorbic-acid-deficient diet, or on a diet supplemented with synthetic ascorbic acid, but only in animals provided with ascorbic acid in raw cabbage. Repetition of these experiments with D2a (10 mg. subcutaneously two

Dose response to 32 and 320 i.u. tuberculin in sensitive guinea-pigs. A=controls; B=ascorbic acid+D2a; C=D2a; D=cabbage+D2a; E=cabbage+cortisone; F=cabbage+propylthiouracil+D2a.

Table I and Chart). The effect of D2a on tuberculin allergy may therefore be more direct than that of cortisone, since its action is linked neither with ascorbic acid metabolism nor with the activity of the thyroid.

Effect on Tuberculin Sensitivity and Antitoxic Immunity in the Same Animal

Three groups, each of ten guinea-pigs, were immunized by the subcutaneous injection into the left leg of 5 LF of diphtheria toxoid in 1 ml. normal saline; at the same time they were sensitized by the intramuscular injection into the right leg of 1.5 mg., dry weight, heat-killed virulent tubercle bacilli in 0.5 ml. liquid paraffin. Twenty-one days later the animals were immunized with a second dose of 5 LF diphtheria toxoid into the left leg. On the 23rd day one group was injected with 10 mg. of cortisone, a second with 50 mg. of D2a, while the third group, serving as controls, received 1 ml. normal saline alone; all injections were subcutaneous. The injections were repeated daily until the

31st day, when both flanks of the animals were depilated, and intracutaneous sensitivity to tuberculin estimated on the left side and to diphtheria toxin on the right side (Miles, 1949; Long, 1950). Both cortisone and D2a produced a comparable depression of tuberculin sensitivity, whereas neither influenced significantly skin sensitivity to diphtheria toxin in these immunized animals (see Table II).

All these animals were then bled by heart puncture, the serum was separated, and individual titrations of diphtheria antitoxin were carried out by the technique of Römer and Sames (1909). In addition, 1 ml. amounts of the sera of each of the three groups were pooled, and the antitoxin contents of the groups compared by passively immunizing guinea-pigs and testing their skin sensitivity to toxin, as described by Miles (1949). By neither method was it possible to detect differences in the antitoxin titre of the three groups. Thus it appears that under the conditions of this experiment neither cortisone nor D2a, in the heavy dosage employed, depressed antitoxin levels, nor did either prevent neutralization of intracutaneously injected toxin; nevertheless, both depressed tuberculin sensitivity to a similar degree, as previously observed.

Discussion

The present series of polyoxyethylene ethers represents a new type of antituberculous agent, with surface-active properties. Their mechanism is obscure, for, apart from producing submerged dispersed growth, they appear to have no direct action on the tubercle bacillus in the test-tube, even at 1% concentration, while there is no evidence of any antibacterial derivative in the blood taken from animals given large doses. Moreover, phagocytosis of tubercle bacilli is not increased, either *in vivo* or *in vitro*, by these agents (Rees and Hart, 1952).

The present work, by demonstrating a depression of skin sensitivity to tuberculin in the guinea-pig, shows that these surface-active agents have an effect on the host. This observation naturally invites comparison with other tuberculin-desensitizing substances, the most notable of which is cortisone (Long and Miles, 1950). The desensitizing effect of the present detergents is comparable in degree to that of cortisone, and, like the latter, does not affect antitoxic immunity in the guinea-pig; but there the analogy ends. For, first, the mechanism of the present effect is different, since it is independent of the dietary and hormonal influences that control the response to cortisone (cf. Long *et al.*, 1951a, 1951b, 1951c). Secondly, the detergents under study are antituberculous, whereas cortisone aggravates tuberculosis in mice (Hart and Rees, 1950). It is less certain that this steroid does so in the guinea-pig, which in resistance to cortisone, ascorbic acid metabolism, and ease of sensitization to allergens is more closely analogous to man than are the mouse and such creatures (Long, 1952). Nevertheless, dramatic effects in cortisone-sensitive animals, such as the mouse, rat, and rabbit, may indicate the trend of less obvious effects in cortisone-resistant creatures such as the guinea-pig and man.

The important role of cellular immunity, and of mononuclears in particular, in resistance to tuberculosis (Lurie, 1939a, 1939b, 1942) is virtually undisputed. On the other hand, repeated attempts to link humoral immunity and resistance to tuberculosis have failed (see, for example, Wilson and Miles, 1946). Cortisone causes lymphopenia and lymphoid atrophy in sensitive creatures (Wells and Kendall, 1940). Such effects are slight and inconstant in the guinea-pig, but, nevertheless, it is possible that cortisone-induced mesenchymal depression grossly outweighs the benefits of desensitization in cortisone-sensitive creatures, and cancels them in resistant ones. Thus only in animals treated with these detergents might anti-allergic activity exist without depression of the local cellular defence mechanism. This interpretation must remain hypothetical until further studies elucidate the problem.

However, we cannot overlook the most interesting observation that, whereas the chemotherapeutically active representatives of the present detergent series desensitized under the

conditions of our experiments, the inactive representatives did not. This association suggests that the mechanism of the chemotherapeutic action and that of the depression of sensitivity may have some common factor. Nevertheless, it must be admitted that there is at present little evidence in favour of the closer relationship of cause and effect—i.e., that the antituberculous effect is in fact due to desensitization. For although the many previous attempts to desensitize tuberculous guinea-pigs have had to be made with tuberculin, the results, taken as a whole, suggest little, if any, advantage to the host. Moreover, the present surface-active agents are equally effective in mouse and guinea-pig tuberculosis, in spite of the very different levels of allergy in these two species. Thus a tuberculin skin reaction cannot be elicited in the tuberculous mouse; and, although this animal can manifest a systemic reaction when tuberculin is given intravenously, much larger doses are required than in the guinea-pig (Smith, 1928; Rees and Hart, 1952). The influence on experimental tuberculosis of a number of other substances that depress tuberculin sensitivity, such as N-acetyl-sphingosine (Fisher *et al.*, 1951), dehydroascorbic acid and alloxan (Long *et al.*, 1951c), will be investigated. If these anti-allergic substances should also prove antituberculous, the hypothesis of a causal connexion between desensitization and chemotherapeutic activity would be strengthened.

Summary

The development of experimental tuberculosis in guinea-pigs is markedly inhibited by injection of certain surface-active polyoxyethylene ethers. Using the response to intracutaneous tuberculin as a measure of allergic hypersensitivity in albino guinea-pigs infected with B.C.G., we find that:

- (1) Single subcutaneous or intravenous injections of these drugs diminish sensitivity to a degree comparable to that of cortisone.
- (2) The chemotherapeutically active representatives of the series diminish tuberculin sensitivity, whereas the inactive members fail to do so.
- (3) Their mode of action differs from that of cortisone, since it is independent of dietary factors and of thyroid activity.
- (4) Neither D2a, a chemotherapeutically active detergent, nor cortisone, in heavy continual dosage, depressed skin sensitivity to diphtheria toxin, or antitoxin levels, in guinea-pigs immunized with diphtheria toxoid (in this experiment the animals were sensitized with dead tubercle bacilli). Both drugs depressed tuberculin sensitivity.
- (5) The possible mode of action of these surface-active agents is discussed.

We are indebted to Dr. Knud Tolderlund, of the State Serum Institute, Copenhagen, for the B.C.G.; to Dr. J. W. Cornforth and Mr. J. A. Stock for preparing the series of surface-active agents; and to Dr. W. L. M. Perry for the statistical analyses.

TUBERCULOSIS IN FAMILIES WITH B.C.G.-VACCINATED AND NON- VACCINATED CHILDREN*

BY

A. W. DICKIE, M.D., D.C.H.

Registrar, Royal Belfast Hospital for Sick Children

Since the introduction of B.C.G. vaccination 25 years ago much has been written to prove or disprove its value. In the Scandinavian countries, in particular, investigators gradually became convinced that the Calmette-Guérin vaccine had a very important part to play in the prevention of primary tuberculosis in both children and adults.

Many workers all over the world have reported surveys demonstrating the protective value of the vaccine. Others found little evidence to support this view. The problem of carrying out controlled investigations to cover all possible variables has made it very difficult to assess its true value. The report of an outbreak of tuberculosis in a school in Denmark in 1943, investigated by Hyge (1947), fulfilled many of the conditions necessary for a true analysis of the protective value of B.C.G. vaccination. The reports of Heimbeck (1929, 1932), Rosenthal, Blahd, and Leslie (1945), and Aronson (1948) are examples of investigations with different types of control groups.

Another approach to the problem is to examine those families in whom some children have been vaccinated and others not. The number of reports of such families in the literature are few. In France, Bertoye (1936) described a family of four children. The second child was vaccinated at birth because it was customary to vaccinate all infants at the maternity hospital where the child was born. In June, 1935, a domestic servant had an unexpected haemoptysis. She was immediately removed to hospital and the diagnosis of tuberculosis confirmed. The following month the three non-vaccinated children (aged 8, 5, and 1½ years) each developed a fever with hilar adenitis and a positive tuberculin reaction. The youngest child later died of tuberculous meningitis. The vaccinated child (aged 6 years) remained quite well.

Selection of Families

A search was made in the records of the Norrtull's Hospital, the Samariten Hospital, and the Central Tuberculosis Dispensary, Stockholm, for families satisfying all the following conditions:

1. That some children in the family had been vaccinated with B.C.G. and some not.
2. That every child said to have been B.C.G.-vaccinated was actually vaccinated and had been negative to 1 mg. of old tuberculin at the time of vaccination. (All B.C.G. vaccinations and the post-vaccinal tests are notified to the Central Tuberculosis Dispensary, and the records were consulted.)
3. That the tuberculin reaction was positive at the time of the check test (at about three months in infants and six weeks in older children).
4. That the tuberculin test had become positive following the vaccination before the time of exposure to an active case of adult tuberculosis.

*This work was carried out at the Paediatric Clinic of the Karolinska Institute, Norrtull's Hospital, Stockholm, during the period of tenure of a Cow and Gate Travelling Scholarship from the Department of Child Health, Queen's University, Belfast.

5. That all the children in the family (and, in this series, in all the families) had been vaccinated with vaccine made in the one laboratory—the Bacteriological Laboratory in Gothenburg.

6. That there was a definite confirmed case of active tuberculosis as the source of infection.

7. That all the children in the family had been in contact with the source of infection.

8. That the duration and time of contact with that case of tuberculosis (the source of infection) was the same for all the children.

In general, it may be stated that all families with B.C.G.-vaccinated and non-vaccinated children exposed to a known source of infection, and irrespective of whether or not there was any case of tuberculosis among the children, are included.

Family 1 (4 Children, 2 Adults)

One of twins, a girl aged 2 years, developed erythema nodosum in July, 1946. She was found to have x-ray evidence of primary tuberculosis, and a tuberculin-jelly test was positive. She was known to have been tuberculin-negative in February, 1946. She had not been vaccinated with B.C.G. When the family was called for a check-up it was found that the other twin, a boy, had an active hilar adenitis and was tuberculin-positive. He also had never been B.C.G.-vaccinated, but was known to have been tuberculin-negative in November, 1945.

The other two children had been B.C.G.-vaccinated—the 17-year-old girl in April, 1944, and the 16-year-old girl a year later. When examined on September 2, 1946, both had normal chest x-ray films and were Mantoux-positive. Repeat examinations in September, 1947, and September, 1948, showed normal chest x-ray films and positive Mantoux reactions.

In August, 1946, the mother was Mantoux-positive and had a normal chest x-ray film. Repeat yearly chest x-ray films up to 1951 remained normal. (She was also known to have had a normal chest x-ray film in March, 1934.) In August, 1946, the father was found to have active tuberculosis, with a positive sputum.

Family 2 (3 Children, 2 Adults)

The mother was discovered to have active tuberculosis with a positive sputum in April, 1949. On follow-up the same month the father's chest x-ray film was clear.

The three children were examined early in May, 1949. One, a 7-year-old girl who had not previously been B.C.G.-vaccinated, was discovered to have active primary tuberculosis with a positive tuberculin-jelly reaction. No previous tuberculin tests were known. At the time of examination she was found to have a pyrexia, which lasted two weeks. This was considered to be the initial fever.

The other two children had been B.C.G.-vaccinated—the 8-year-old boy in November, 1948, and the other boy, aged 10, the previous year. Both had normal chest x-ray films and were positive to tuberculin-jelly tests.

Family 3 (4 Children, 2 Adults)

The mother of this family had pleurisy in 1942 and developed lupus vulgaris in November, 1946. At this time her chest x-ray film showed nothing very definite—there was just a suspicion of a slight interlobar effusion. A year later her chest x-ray film was normal. However, in May, 1948, she was found to have pulmonary tuberculosis. On follow-up the same month (May, 1948) the father's x-ray film was normal, but a 14-year-old boy was found to have a raised temperature (considered the initial fever), persisting for some weeks. His x-ray film showed primary tuberculosis and his Mantoux reaction was positive. There was no knowledge of previous tuberculin tests and he had not been B.C.G.-vaccinated.

Two boys, aged 4 and 5 years, were B.C.G.-vaccinated in 1944 and 1943 respectively. The 15-year-old girl had been

B.C.G.-vaccinated in 1941. These three children had normal chest x-ray films and were positive to tuberculin tests in May, 1948.

Family 4 (3 Children, 2 Adults)

A 4-year-old boy was found to be positive to the tuberculin-jelly test and to have a hilar adenitis in October, 1948. His E.S.R. was 34 mm. in one hour. The previous June he was known to have had a rise in temperature lasting about three weeks. This may have been the initial fever. There was no knowledge of previous tuberculin tests and he had never been B.C.G.-vaccinated.

At a follow-up examination in November, 1948, a second boy, aged 6 years, was found to have primary tuberculosis. His tuberculin-jelly reaction was positive and his E.S.R. 41 mm. in one hour. Tubercle bacilli were isolated from his gastric washings. This boy also had a history of a rise in temperature in June, 1948. Again there were no known tuberculin tests, and he had not been B.C.G.-vaccinated.

The third child, a boy aged 14, had been vaccinated with B.C.G. in November, 1945. On follow-up examination in December, 1948, he was positive to tuberculin jelly and his chest x-ray film was normal.

The parents were examined in December, 1948. The father's chest x-ray film showed active tuberculosis. He also gave a history of an attack of pneumonia the previous May. At this time the mother's x-ray film showed some suspicious changes, and these progressed to obvious active disease within a year. Her Mantoux reaction was positive.

Family 5 (2 Children, 2 Adults)

A 2-year-old boy was negative to the tuberculin-jelly test in May, 1946. In June, 1946, this test was strongly positive, and he was found to have an active hilar adenitis. He ran a high temperature—the initial fever—for a fortnight. He had not been B.C.G.-vaccinated.

At a follow-up examination in June, 1946, his 5-year-old brother, who had been vaccinated with B.C.G. in the autumn of 1945, had a positive tuberculin-jelly reaction and a normal chest x-ray film.

The mother was examined the same month. She was tuberculin-positive and an x-ray film of her chest was normal. Yearly repeat examinations for the next four years were clear. The father was examined in July, 1946. His chest x-ray film showed active tuberculosis and his sputum contained tubercle bacilli.

Family 6 (4 Children, 2 Adults)

On Christmas Eve, 1947, three of the children (girls aged 3, 4, and 6 years) developed erythema nodosum. All were positive to tuberculin-jelly tests and suffering from primary tuberculosis. There were no known previous tuberculin tests, and none of them had been vaccinated with B.C.G.

At a follow-up examination the 2-year-old girl, who had been B.C.G.-vaccinated shortly after birth in November, 1945, was found to have some suspicious enlargement of the hilar glands and to be tuberculin-positive. She had a history of having just recovered from whooping-cough. Her hilar shadows were considered to be within normal limits in three months and again a year later.

The follow-up examination showed that chest x-ray films of both parents were normal. It was then found that an uncle had arrived on November 21, 1947, and stayed with them for three weeks; during this time he had become ill. He was admitted to a sanatorium on January 4, 1948, with cavitation and a positive sputum.

Family 7 (3 Children, 2 Adults)

A boy aged 4 years was first seen in October, 1949, and there was a history of his "not being well" since the previous July, when he was known to have had a rise in temperature for some weeks. He was found to be positive to tuberculin jelly and had a primary complex. On looking

back it was thought that his initial fever may have occurred in July. He had never been vaccinated with B.C.G. and he was not known to have had any previous tuberculin tests.

At a follow-up examination in October, 1949, the 11-year-old boy was also found to have a positive tuberculin reaction. At first his chest x-ray film was suspicious. His E.S.R. was 7 mm. in one hour. Further x-ray films did not show any change and there was little evidence of active disease at any time. He had not been B.C.G.-vaccinated and he was not known to have had any previous tuberculin tests.

The 8-year-old girl, who had been vaccinated with B.C.G. the previous year, had a normal chest x-ray film and was Mantoux-positive (1 mg.).

Both parents were examined in October, 1949. Their chest x-ray films were normal and both were positive to 0.05 mg. of old tuberculin.

It was then found that the three children had been staying with their grandmother during the summer. She was examined in the local tuberculosis clinic in October, 1949, and evidence of old changes was found on the chest x-ray film. During this investigation a suspicion arose that a friend of the family with whom the children had been in contact might be the source. He was called for examination and was found to be Mantoux-positive (0.05 mg.). His chest x-ray film showed active tuberculosis, and tubercle bacilli were isolated from his sputum during the first week of November, 1949.

Family 8 (2 Children, 2 Adults)

The mother's sister was found to have tuberculosis in 1947. Tubercle bacilli were present in her sputum, and she died two years later. She was known to have had a chest lesion in 1941.

At a follow-up examination in April, 1947, the 6-year-old boy was found to be positive to the tuberculin-jelly test and to show radiological evidence of primary tuberculosis. Besides the recent contact with his aunt, he had lived with her for a period in 1943. However, his chest x-ray films were normal in October, 1945, and June, 1946. He had not been vaccinated with B.C.G.

His 5-year-old sister was B.C.G.-vaccinated in 1941. There is some doubt about the post-vaccinal tuberculin test. The case records showed her to have been positive then, but the mother could not recall it. She was now tuberculin-positive. She had normal x-ray films between January, 1945, and April, 1947. In November, 1947, there was some degree of hilar enlargement, but an x-ray film six weeks later was normal. Her E.S.R. in April and December, 1947, was 5 mm. in one hour, and in March, 1948, 10 mm. in one hour.

A third child*, a boy, was born in September, 1946, and vaccinated with B.C.G. a short time after birth. He was kept in a children's home for his first year of life and never had any contact with his tuberculous aunt. Six x-ray films between November, 1947, and January, 1951, were normal. Yearly tuberculin tests up to January, 1951, remained positive.

The parents' x-ray films did not show any evidence of tuberculosis, but the mother did have a lesion in 1942. She never had any tubercle bacilli in her sputum.

Family 9 (2 Children, 2 Adults)

The father of this family was found to have active tuberculosis in November, 1948, and a positive sputum. His Mantoux reaction (0.05 mg.) was positive. His wife had been B.C.G.-vaccinated in November, 1947. On follow-up she was still Mantoux-positive (0.05 mg.) and had a normal chest x-ray film.

*This child is excluded from the investigation as he had no contact with the source of infection. The other two children had three possible times of infection—from the aunt in 1941, their mother in 1942, and again their aunt in 1947. In view of the x-ray findings it seems likely that these children were infected just before the aunt was discovered, in April, 1947, to have become active again.

The 2-year-old girl was examined in the first week of January, 1949. She was positive to the tuberculin-jelly test and had an active hilar adenitis. A few weeks later her E.S.R. was 40 mm. in one hour. There was also a history of a rise in temperature just before Christmas, 1948, and it was thought possible that this may have been the initial fever. She had not been vaccinated with B.C.G., and there were no known previous tuberculin tests.

An 11-months-old boy had been B.C.G.-vaccinated at birth. His chest x-ray film was normal and a tuberculin-jelly test was positive.

Family 10 (2 Children, 2 Adults)

An uncle of these children was known to have had tuberculosis in 1944 and to be Mantoux-positive. The two children were in contact with him off and on from the spring of 1946 to the beginning of 1947. He was then discovered to have tubercle bacilli in his sputum.

At a follow-up examination in March, 1947, the 4½-year-old girl was positive to the tuberculin-jelly test and had active primary tuberculosis. She had not been vaccinated with B.C.G., but was known to have been tuberculin-negative three months before.

The 15-year-old boy had been B.C.G.-vaccinated in 1944. His Mantoux (0.05 mg.) was positive and his chest x-ray film normal.

Both parents, when examined in March, 1947, were Mantoux-positive (0.05 mg.) and their chest x-ray films normal.

Family 11 (4 Children, 2 Adults)

A 4-year-old girl was found to be positive to the tuberculin-jelly test in the second week of January, 1950, and to have primary tuberculosis. No previous tuberculin tests were known, and she had not been B.C.G.-vaccinated.

At a follow-up examination the same month the 7-year-old boy was found to be positive to the tuberculin-jelly test and to have active hilar adenitis. It was considered that a rise in temperature he had had in December, 1949, may have been the initial fever. There were no known previous tuberculin tests and he had not been vaccinated with B.C.G.

The 1-year-old boy had been B.C.G.-vaccinated at birth and the 11-year-old boy over two years previously. Both were tuberculin-positive and had normal chest x-ray films.

When the father was examined he was found to have evidence of active tuberculosis. There was no record of the mother having been x-rayed.

Family 12 (2 Children, 2 Adults)

After the discovery of active pulmonary tuberculosis in their aunt this family was investigated in October, 1944. This aunt had also had tuberculosis of a foot bone and erythema nodosum twice. No tubercle bacilli had ever been found in her sputum.

The 3-year-old boy was tuberculin-positive and had an active hilar adenitis. There was no knowledge of previous tuberculin tests and he had not been B.C.G.-vaccinated.

The 9-months-old boy had been B.C.G.-vaccinated at birth. His chest x-ray film was normal and he was tuberculin-positive.

The mother's chest x-ray film was clear and she was Mantoux-positive (1 mg.). The father was never traced, as he had deserted the family.

Family 13 (2 Children, 2 Adults)

The 3-year-old boy developed phlyctenular conjunctivitis in October, 1947. He was Mantoux-positive (0.05 mg.) and had active hilar adenitis. There were no known previous tuberculin tests and he had not been vaccinated with B.C.G.

At a follow-up examination in November, 1947, the 2-year-old boy, who had been B.C.G.-vaccinated at birth, was found to be positive to the tuberculin-jelly test and to have a normal chest x-ray film.

The parents were also examined in November, 1947. The mother was Mantoux-positive (0.05 mg.) and had a clear chest x-ray film. The father was also Mantoux-positive (0.05 mg.), but he had a positive sputum, and a tuberculous cavity was shown on the chest x-ray film.

Family 14 (2 Children, 2 Adults)

A 1½-year-old boy was admitted to hospital with erythema nodosum at the end of October, 1945. His tuberculin-jelly test was positive and he had an active primary tuberculosis. There were no known previous tuberculin tests and he had not been vaccinated with B.C.G.

The 4-year-old boy had been B.C.G.-vaccinated in November, 1942. In November, 1945, he was tuberculin-positive and his chest x-ray film was clear.

Both parents were Mantoux-positive and had clear x-ray films. An aunt with whom the children had been in contact was now suspected. She had a positive sputum, and multiple cavities were shown on an x-ray film. She died seven months later.

Family 15 (2 Children, 2 Adults)

A 2½-year-old boy was found on routine examination to be positive to a tuberculin-jelly test in April, 1948, and to have a hilar adenitis. There were no known previous tuberculin tests and he had not been vaccinated with B.C.G.

The 4½-year-old boy had been B.C.G.-vaccinated in April, 1946. His tuberculin-jelly test was positive and his chest x-ray film clear on follow-up examination in April, 1948.

The mother's chest x-ray film was clear and she was Mantoux-positive (0.05 mg.). The father was known to have had tuberculosis in 1940. He was examined twice yearly from then on, but was never regarded as infectious. He was at work all this time. Their maid, who was found to have active bilateral tuberculosis towards the end of 1947, was considered the source of infection.

Family 16 (3 Children, 2 Adults)

A 6-year-old boy developed chicken-pox in 1948. He did not quite recover, but remained "out of sorts." During the first few days of January, 1949, he was found to be tuberculin-positive and to have primary tuberculosis. There was no knowledge of previous tuberculin tests and he had not been vaccinated with B.C.G.

Twin girls aged 1½ years had been B.C.G.-vaccinated in July, 1947. They were both tuberculin-positive (jelly and 0.05 mg. old tuberculin) and both had normal chest x-ray films.

Both parents were also Mantoux-positive (0.05 mg.) in January, 1945, and their chest x-ray films were clear.

It was then discovered that the family had visited their grandfather between October and Christmas, 1948. (Their grandmother had died 25 years previously with tuberculosis.) The grandfather was examined in February, 1949. He was found to be tuberculin-positive and to have active tuberculosis.

Comment on Cases

The diagnosis of primary tuberculosis was confirmed by the head of each hospital. (Families 1-10 by Professor A. Wallgren at Norrtull's Hospital and families 13-16 by Professor N. M. Malmberg at the Samariten Hospital. In family 11, one child was admitted to Norrtull's and the other to the Samariten. Family 12 was seen only at the Central Tuberculosis Dispensary.) All the children not admitted to hospital, the parents, and other relatives, etc., were examined by tuberculosis medical officers in the Central Dispensary, except those, sometimes the sources of infection, living in country districts, who were examined by local tuberculosis officers and admitted to local sanatoria.

Tubercle bacilli were isolated from the gastric washings of some of the children with primary tuberculosis, but no gastric washings were carried out in the vaccinated children. Hence this part of the investigation is of no value.

Discussion

In all there were 16 families, with 22 vaccinated and 22 non-vaccinated children, and each family satisfied all the given conditions. There is therefore a group of children some of whom act as controls and the others as tests of the protective value of their B.C.G. vaccination. The source of infection for all the children, while not the same, is at least similar. Within each family the familial susceptibility to tuberculosis is probably the same, although the resistance may be influenced by the age-composition of the family.

When the source of infection lies in the home, it may be assumed that each child was exposed to the maximum possible risk. The social conditions, especially overcrowding, will vary between each family, but the children in each individual family will live under the same conditions and their standard of nutrition will tend to be the same.

Why some children should have been vaccinated and others not is not very clear. It seems most likely that the mother was offered vaccination for some of the children on one particular occasion—for example, at a school medical examination, at a child welfare centre, or at a maternity hospital—but did not trouble to have the remaining children vaccinated.

One criticism might be that the non-vaccinated children were left because they were known to be tuberculin-positive. In most of the non-vaccinated children there were no known previous tuberculin tests. This, coupled with the presence of active primary disease, would make it unlikely that they had been tuberculin-positive when the other children were vaccinated with B.C.G. One possible exception might be the boy aged 11 in family 7.

There is no reason to believe that any form of selection (such as not vaccinating a child with a chronic illness) occurred among either group of children. It is often said that only the most careful and intelligent mothers will have their children vaccinated, and that this in itself is a great source of selection when using non-vaccinated children in other families as controls. This does not apply to the present series.

The question of race does not arise so far as comparison between each group is concerned, as all the children were Swedish. The possibility of an occupational risk has to be considered in the older children. All the non-vaccinated were 14 years or under (20 of the 22 were under 9 years). There can be no question of an occupational risk in this group. Four of the vaccinated children were 15 years or over; three of them were girls. Despite the known increased risk at puberty and during adolescence, especially in females, and despite a known intimate contact with a source of infection, all these four children (and a 14-year-old boy) were completely protected. Indeed, it must be expected that these older children will have a greater circle of acquaintances outside the immediate family circle and will have the added risk of a casual infection.

It is very unlikely that the question of sex is important before puberty. Age, however, is most important. It is generally accepted that children under 5 years have a much more severe reaction to a primary tuberculous infection than older children. Two of the B.C.G.-vaccinated children had suspicious x-ray films at first (families 6 and 8). Both were under 5 years old, and were the youngest in the family. This probably occurred by chance, because suspicious lesions may occur in B.C.G.-vaccinated children at any age. It is worth noting that the mother of family 6 volunteered the information that, of all her children, the youngest (aged 2) had played continuously with the source of infection for days before his tuberculosis was suspected. In neither of the cases did definite primary tuberculosis develop. On the other hand, a non-vaccinated boy aged 11 (family 7) was under suspicion at first, while his younger brother, aged 4, had a typical infection and his sister, aged 8, who was vaccinated with B.C.G., was completely protected.

Table I shows the classification of the children into four age groups, according to whether they were B.C.G.-vaccinated or not. It is seen that, in general, the vaccinated children

TABLE I

Age	Non-vaccinated			Vaccinated		
	Obvious Primary Tuberculous Complex	Suspect Primary Tuberculous Complex	Total	No Evidence of Primary Tuberculous Complex	Suspect Primary Tuberculous Complex	Total
0- ..	14	0	14	9	1	10
5- ..	6	0	6	4	1	5
10- ..	1	1	2	3	0	3
15+ ..	0	0	0	4	0	4
	21	1	22	20	2	22

were in the minority in the two lowest groups and in the majority in the highest. This is of importance, as it is likely that the young children were more at-home than the older children and therefore more exposed to any source of infection within the family. It is of interest, however, to look separately at the different age groups. One child among the vaccinated in each of the two lower age groups had some clinical evidence of primary infection—that is, one of the 10 B.C.G.-vaccinated children under the age of 5 years had some evidence of primary infection, whereas all 14 of the non-vaccinated became clinically ill. Similarly, only one of the five vaccinated children between 5 and 10 years developed some evidence of primary disease, compared with obvious infection in the six non-vaccinated. The other two groups are too small for any conclusions to be drawn.

Family 1 contains two adolescent girls protected, and twins aged 2 years who developed erythema nodosum and primary tuberculosis. In family 16, twins aged 1½ years were protected and a boy of 6 years was infected. Family 3 shows a 14-year-old boy infected and a girl of 15 years and two boys aged 4 and 5 years protected. Families 9 and 12 have two children under 1 year protected, while the other children were infected. In family 11, the two protected children were aged 1 year and 11 years and the two infected children were in between (aged 4 and 7 years). Even in such a small group, then, there is evidence of protection at all ages of childhood. No cases of tuberculous meningitis or miliary tuberculosis occurred in either group.

Table II shows the distribution of the children, by families, in each group and the source of infection. In 8 of the 16 families the source was either the father or the mother; in 5 an aunt or an uncle; and in the rest a grandfather, a maid, and a friend of relatives whom that family had visited. The mother of family 8 had had tuberculosis five years before, but was not considered likely to be in-

fectious at the time. The children had, however, been in contact with an aunt who was found to have active tuberculosis and who died two years later.

B.C.G. vaccination offers a relative rather than a complete protection against primary tuberculosis—that is, it raises the resistance to a subsequent superinfection, with virulent organisms. It is most likely that all the vaccinated children in this series were superinfected, but only two showed a possible hilar reaction of short duration.

The incidence of tuberculosis in vaccinated and non-vaccinated children admitted to Norrtull's Hospital between 1945 and 1949 inclusive is interesting. Of 625 cases of primary tuberculosis, 26 had been vaccinated with B.C.G. (excluding 9 who had been vaccinated during the incubation period); 12 of these 26 cases were mild and 14 more or less typical, but some of the latter had been vaccinated so long before that it is very likely the immunity had disappeared. In addition, there were 137 cases with spontaneous positive tuberculin reactions. During this five-year period 1,352 vaccinated children were admitted and 7,279 non-vaccinated; and 26 (1.9%) of the vaccinated children had tuberculosis, compared with 599 (8.2%) cases among the non-vaccinated children. There were 28 cases of tuberculous meningitis and/or miliary tuberculosis in the non-vaccinated group and none in the vaccinated group. These figures are not representative of the children of Stockholm, and apply only to the hospital admissions.

The difference in the number of vaccinated and non-vaccinated is surprisingly great. This is partly explained by the fact that in the non-vaccinated group are included infants under 3 months who were vaccinated at birth but were not yet tuberculin-positive, and partly because there has been a very great increase in the number of vaccinations in recent years, so that the proportions for 1949 are quite different from those of 1945. Parallel with this rise in the number of vaccinated children there has been a fall in the number of cases of primary tuberculosis—from 183 admissions in 1945 to 88 in 1949, with an average of 123 in the intervening years.

Summary

A description is given of 16 families in which some children were vaccinated with B.C.G. and others not, and in which all had been exposed to a known source of infection. Reasons are put forward for considering the two groups comparable. Among the 22 children in the non-vaccinated group 21 developed primary tuberculosis. In the B.C.G.-vaccinated group, two at most showed some evidence of superinfection.

The protective value of B.C.G. vaccination is striking, both when the source of infection is within the family (with the maximum risk for each child) and when it is outside.

The difference in the incidence of tuberculosis in the vaccinated and non-vaccinated children admitted to Norrtull's Hospital is recorded and a brief description of the fall in the number of cases of primary tuberculosis from 1945 on is given. The absence of tuberculous meningitis and miliary tuberculosis in the vaccinated group is noted.

I wish to thank Professor N. M. Malmberg and Dr. C. M. A. Gentz for granting me access to the records of the Samariten Hospital and the Central Tuberculosis Dispensary respectively, and to express my appreciation to Dr. Sven-Ivar Rollof for his help in the interpretation of the case records. I should especially like to thank Professor A. Wallgren for his constant help, encouragement, and criticism in the preparation of this paper.

HEAD-DROPPING TEST

BY

ROBERT WARTENBERG, M.D.

*(From the University of California School of Medicine,
San Francisco)*

This test serves, first of all, in the early diagnosis of paralysis agitans and post-encephalitic Parkinsonism. The latter term is an awkward one, and has already led to such a stylistic horror as "Rombergism," to which "Babinskiism," it is hoped, will not be added. Therefore the generic term "Parkinson's syndrome" is used here, and the terms "idiopathic," "post-encephalitic," etc., are used to distinguish the varieties.

It is easy to diagnose a fully developed case of Parkinson's syndrome of any variety. Often there is an immediate impression of the condition which later proves to be correct, although at the time the impression was gained no adequate proof could be offered. However, it is sometimes difficult to diagnose cases that are just beginning to manifest themselves, or abortive cases, the so-called "formes frustes." The beginning and the course of Parkinson's syndrome of any variety is usually insidious and slow, and this makes the diagnosis particularly difficult.

In post-encephalitic Parkinson's syndrome it may be impossible to obtain a clear history of encephalitis, or the encephalitis may have occurred as long as 15 or 20 years previously, rendering some histories unreliable. The long so-called pseudo-neurasthenic stage of post-encephalitic Parkinson's syndrome, with its manifold and vague symptoms, particularly contributes to the diagnostic confusion. Many and varied morbid conditions must be considered in the differential diagnosis in such cases: diverse degenerative and non-degenerative diseases of the brain, multiple sclerosis, exophthalmic goitre, senile tremor, familial tremor, arthritis, as well as psychoneurotic, neurasthenic, and hysteric states and various intoxications.

How difficult to some clinicians the diagnosis may be is drastically demonstrated by the fact that I have seen patients with unmistakable Parkinson's syndrome who previously had been subjected to encephalography and angiography in the search for a tumour.

Tests in Early Diagnosis of Parkinson's Syndrome

The early diagnosis of this condition has long engrossed investigators, and many tests have been devised for this purpose. Some of these are: (1) Abnormal position of hand and fingers, particularly of the thumb. (2) Easy exhaustibility of fine finger movements. (3) Positive push test: on a sudden push backward, the patient, standing erect, does not involuntarily dorsiflex the foot and toes on the affected side. (4) Arm-deviation test: When the patient, with his eyes closed, stands with arms outstretched in front of him there is a tendency for the arms to move inward and downward. (5) Overestimation of weight of objects placed in the affected hand. (6) Cogwheel rigidity of muscles: On quick passive stretching, the examiner feels short jerks in the stretched muscles of the patient. (7) Fixation of position test (a so-called postural reflex): The examiner places his thumb on the biceps tendon, and with the other hand passively flexes the forearm of the patient; on every movement the thumb feels that the biceps tendon tightens so as to fixate the forearm in every given position. (8) Paresis of convergence of the eye muscles. (9) Hypometria, micro-

graphia. All these tests have a sound physiological basis, and are useful. However, it cannot be said that they become manifest early in the disease.

For many years I have been accustomed to base the diagnosis of early Parkinson's syndrome on the following tests: (1) Exaggeration of the orbicularis oculi reflex: closure of the eyes on tapping the glabella (Wartenberg, 1945). (2) Diminution of pendulousness of the arms in walking, and diminution of pendulousness of the legs. For the latter test the patient sits on the table with his legs hanging freely. The examiner lifts the legs, lets them swing freely, and appraises their swinging time. This time is conspicuously shorter in Parkinson's syndrome, particularly when only one side is affected (Wartenberg, 1951). (3) Increased resistance in the neck muscles as felt by the examiner when he moves the head of the patient in different directions.

This third test, based on the rigidity of the neck muscles, has seemed particularly useful, though the method is somewhat crude. However, its physiological rationale is sound.

Tremor and Rigidity

The fundamental motor disturbances in Parkinson's syndrome can be traced to two main factors—tremor and rigidity. Which of these is the more important? The first observers stressed tremor. This is understandable, since, both for the patient and for the doctor, it is the more conspicuous, the more striking manifestation of the disease, especially so since the tremor affects predominantly the distal parts of the extremities, and is more obvious and disturbing to the patient. I have seen many such patients with both tremor and rigidity who complained only of the tremor.

Later investigators stressed rigidity at the expense of tremor. The tendency has now become to regard tremor as the non-essential, secondary feature, and to emphasize the existence of paralysis agitans *sine agitatione*. "I for my part," said Lewy (1932), "reject paralysis agitans *sine rigiditate*." This is in accordance with my own experience. I have seen patients with Parkinson's syndrome of any variety showing rigidity without tremor. For me the more significant element of the pallid syndrome is rigidity, which is always present. Wilson (1940, p. 799), however, said: "Examples of paralysis agitans *sine rigiditate* are seen once in a while; they include akinesia, tremor, sometimes Parkinsonian postures, but not hypertonia." Though there is certainly Parkinson's syndrome without tremor, I doubt very much that there is Parkinson's syndrome without rigidity. In cases in which allegedly there was no rigidity the technique of examining for tonus has probably been faulty.

What comes first in the syndrome, tremor or rigidity? Many textbooks assert that in most cases tremor is the first sign. But it is admitted that occasionally tremor may appear some years after rigidity. Gowers (1893) found that rigidity may constitute "the first symptom of the disease." According to Wilson (1940, p. 791), "slowness and rigidity precede visible shaking in a considerable number." It is the post-encephalitic condition, particularly, that may show marked rigidity in the early stages, and only later may the tremor become apparent.

Where does rigidity in Parkinson's syndrome start? It is generally assumed that it starts in the proximal muscles of the limbs, particularly the upper. It is my belief that the rigidity starts in the neck and shoulder muscles, particularly in the flexors of the head. This leads to the sustained flexor position of the head, an early sign. As the disease advances and spreads this rigidity still remains more pronounced in the flexors of the head than in any other muscles of the body.

The textbooks point out the occurrence of the hemiparkinson syndrome. I would also like to stress the occurrence of a cervico-brachial type. This type is seen particularly in the idiopathic variety. In such cases the rigidity affects the muscles of the neck and shoulders predominantly or exclusively. The leg muscles are much less affected, or not affected at all.

Neck Rigidity

My long-held view that rigidity in Parkinson's syndrome affects the muscles of the neck first and foremost I found also to be held by Vujic (1927). He speaks of "pronounced extrapyramidal hypertonia of the neck muscles," in cases of post-encephalitic Parkinson's syndrome. "The same hypertonia," says Vujic, "is often found in the limbs in less pronounced degree, sometimes much more distinctly in the arms than in the legs, and especially in the proximal parts. . . . Hypertonia is ascertained by means of passive movement of the head and limbs."

In photographs of some cases the prominence and tension of the sternocleidomastoid muscles which produce the forward bending of the head are conspicuous. "In the recumbent posture sternomastoids do not slacken" (Wilson, 1940, p. 794). How strongly this position of forward bending of the head is can be demonstrated convincingly by the following. When a patient with advanced Parkinson's syndrome is asked to lie supine, his occiput does not touch the supporting surface on which he lies. He keeps his head up from the surface indefinitely, even if he is admonished to relax (see illustration).

Advanced Parkinson's syndrome. Typical posture of head of patient lying supine: the head is kept flexed indefinitely and off the surface.

Professor Robert Bing has drawn my attention to the fact that Steck (1926, 1927) apparently was the first to describe this *oreiller psychique* (psychic pillow), which was seen in his patients with psychosis accompanied by extrapyramidal syndromes. Steck graphically illustrated this "psychic pillow." While the phenomenon was found by him in psychotic patients who had extrapyramidal signs, none of my patients was in any way psychotic, and the "psychic pillow" was due here exclusively to the extrapyramidal rigidity of the neck muscles. The term "psychic pillow" certainly cannot be applied to cases of Parkinson's syndrome. The "pillow" here is not "psychic" but grossly "organic." It is hardly correct to call it "psychic" even in Steck's cases with psychosis, since these show extrapyramidal syndromes to which this position of the head must be attributed in the first place.

From a physiological standpoint this early bending position of the head in Parkinson's syndrome is easy to understand. The postural factor is considered to be determined by the "loss of righting reflex" (Brock and Wechsler, 1927), fundamental for this disease. In Parkinson's syndrome there is a "dissolution of erectness" (Kraus, 1924), a disintegration of the erect posture in man. The forward bending of the head is the very first expression of this disintegration.

If this be so, if indeed rigidity of the neck muscles is an early sign of Parkinson's syndrome, then the best test for this rigidity would be a test which demonstrates the rigidity of the flexors of the head. This, in fact, is the basis for the head-dropping test.

Technique of the Head-dropping Test

The patient lies supine on a horizontal examining table, without a pillow. The surface should not be hard, but padded. He is made to relax completely and should not try to raise his head, as he is always inclined to do. He is asked to close his eyes, his attention is diverted, and he is engaged in conversation. His head rests on the table surface. The examiner places his left hand under the patient's occiput, the dorsum resting on the table and the occiput lying in the examiner's palm. Then, with his right hand, the examiner suddenly, unexpectedly, and briskly lifts the patient's head and allows it to drop.

In normal persons the head drops back on to the left hand of the examiner with force, like a dead weight. It is as if there were no tonus of the neck muscles at all, as if the head were attached to the body by a string. This complete lack of tonus is in gross contradistinction to the marked tonus the neck muscles exhibit when the patient is erect. One is amazed at the sharp impact with which the head falls heavily and inertly backwards, an impact felt distinctly by the examiner. The fall is so heavy that, were it to occur on a hard surface, the patient could sustain an injury. It even might hurt him if his head should happen to fall on a ring the examiner was wearing. It is essential that the patient be completely relaxed. In the rare instances where complete relaxation cannot be achieved the test must be given up for the time being. In any case it is advisable to repeat the test. If after several examinations varying results are obtained the heaviest drop counts; in all others it must be assumed that some active interference has taken place on the part of the patient.

The test can also be performed on the patient lying prone, or on either side, but it is much more easily performed and its results are less difficult to evaluate when the patient lies supine. The rigidity of the neck muscles is evidently greater in the flexors than in the retractors of the head. It must be assumed, therefore, that the dropping of the head is slower when the patient lies supine than when he lies prone. However, this is difficult to prove.

The most striking change from the normal in this head-dropping test is seen in Parkinson's syndrome even in the earliest stages. Here the head drops slowly and gently; the downward movement is, so to speak, reluctant, hesitant, and lazy. The slow dropping of the head shows that, though the rigidity of the muscles in Parkinson's syndrome is generally diminished when the patient assumes a recumbent position, the rigidity of the neck muscles still remains considerable. In character this movement is the same as that felt by the examiner when he passively stretches a rigid extremity. The downward movement of the head maintains an even flow, is smooth, and is uniform from beginning to end. There is no sudden "give," no erratic unevenness. The smoothness and evenness of the movement are clearly seen in slow-motion pictures. If the patient interferes voluntarily and makes a movement with his head, this immediately can be distinguished as such.

The examiner is able to appraise the character of the motion not only by sight but by touch as well. In the palm of his hand he can feel the degree of impact of the dropping head. Compared with the violent impact in normal subjects, in Parkinson's syndrome the head drops softly and smoothly. The difference between the normal and the pathological is unmistakable, even in the earliest stages of the syndrome. I have seen quite a number of patients with Parkinson's syndrome who did not complain of rigidity anywhere, yet in whom the head-dropping test proved to be typical for this disease. In advanced cases the test is not necessary. Here the rigidity of the neck muscles is too obvious to need any special tests. As shown above, this rigidity is strikingly illustrated by the fact that the patient with advanced Parkinson's syndrome lying supine keeps his head bent and off the surface (see illustration). This is, so to speak, a "frozen" head-dropping test. In Parkinson's syndrome the test has

been found abnormal so regularly, and this abnormality has been so clear and unequivocal, that I dare state that if the head-dropping test is normal the syndrome can be excluded.

The Test in Differential Diagnosis

The test is of great importance in differential diagnosis: Parkinson's syndrome *versus* senile tremor.

I have seen cases of tremor diagnosed by authorities as Parkinson's syndrome in which the head-dropping test was later found to be normal. This led to further clinical investigation which proved beyond doubt that the patient suffered from senile tremor and not Parkinson's syndrome. Again and again I have found that the latter diagnosis is made too often. The differential diagnosis between these two conditions may be very difficult, since they have many clinical features in common. It is true that there is a difference between senile and parkinsonian tremor, yet tremor *per se* gives no decisive clue for differential diagnosis. The outstanding characteristic of senile tremor—involvement of the head—may occur also in Parkinson's syndrome. It is therefore understandable that many authors, even quite recently, have maintained that the senile tremor is just a "forme fruste" of paralysis agitans. However, a differential diagnosis is of importance particularly with regard to prognosis, since senile tremor is a benign, non-progressive lesion, while Parkinson's syndrome is not. In this differential diagnosis, parkinsonian tremor *versus* senile tremor, the head-dropping test is of decisive importance.

The outstanding sign of the senile tremor is the invariable absence of rigidity. The head-dropping test, being the most sensitive test for rigidity, decides the issue. It is always unmistakably and completely normal in senile tremor.

Dr. Charles Kunkle tried this test on a 70-year-old woman who had had a typical essential hereditary tremor for 30 years. In a personal communication he states: "When put to the test her head dropped in entirely normal fashion, like a true dead weight."

Other Tests

Next to the head-dropping test, the following have proved to be helpful in the early diagnosis of Parkinson's syndrome:

(a) *Shoulder-shaking Test*.—The examiner places his hands on the patient's shoulders, shakes them briskly by alternating movements to and fro, and observes the passive swinging of the arms thus produced. On the side affected by Parkinson's syndrome the range of the swinging is less than on the healthy side. When both sides are affected the diminution of swinging runs parallel to the rigidity. However, quite the opposite prevails in a cerebellar affection. Here the range of the swinging is greater on the affected than on the healthy side.

(b) *Arm-dropping Test*.—The examiner, standing in front of the patient, puts his hands on the sides of the patient's trunk, dorsum outward, at the level of the wrists. The patient is made to relax. With a sudden, quick, outward movement the examiner thrusts the patient's arms up and allows them to fall and strike the dorsum of his own hand. The examiner sees, feels, and hears that the impact of the falling arm on the side affected with Parkinson's syndrome is slowed up and not as heavy as that on the healthy side. The more the side is affected the softer and more retarded is the impact of the falling arm.

(c) *Pendulousness of the legs* (as described above).

A tremor may show the greatest similarity to Parkinson's syndrome, but when the head-dropping test and these three tests are normal then the syndrome can certainly be excluded. Thus far I have not seen any case of Parkinson's syndrome of any degree, of any variety, in which the head-dropping test was normal.

Head-dropping Test in Extrapyrimal Diseases

Since the neck muscles are a place of predilection in many other affections of the extrapyramidal system, it is understandable that an abnormal head-dropping test is found in such extrapyramidal conditions as Wilson's disease, torsion dystonia, striatal torticollis, and pallidal degeneration. Thus the dropping of the head as seen in Parkinson's syndrome indicates involvement of the neck muscles in extrapyramidal affections and even the degree of this involvement. It has proved helpful in cases of cortico-striato-spinal degeneration belonging to the group of spastic pseudosclerosis, and of olivo-ponto-cerebellar atrophy, pointing to the existing extrapyramidal component in these diseases. Generally speaking, a pathological head-dropping test in any complicated morbid condition indicates concomitant involvement of the extrapyramidal system.

We have thus far learned one outstanding characteristic of the head-dropping test: it shows striking changes in affections of the extrapyramidal system. There is another feature of this test which makes it valuable for differential diagnosis of extrapyramidal and pyramidal affections; it is that the head-dropping test does *not* show any marked or substantial change in pyramidal affections, not even in those in which both pyramidal tracts are affected intracranially.

A completely or nearly completely normal head-dropping test has been observed in patients with bilateral pyramidal lesions, which include an involvement of the pyramidal cortico-cervical tracts. These were cases of spastic tetraplegia with positive snout reflex, positive head retraction reflex, and markedly exaggerated jaw reflex. Some cases showed marked supranuclear bulbar ("pseudobulbar") signs and pathological laughing and crying. The common hemiplegia, of course, also shows a normal head-dropping test, and so does any affection of the cerebellum.

This being so, a pathological head-dropping test in diffuse affections of the brain points to extrapyramidal involvement. In diffuse hypertensive encephalopathy and in multiple sclerosis there may be such an extrapyramidal component. This can be ascertained and appraised by means of the head-dropping test.

The statement just made, that affections of the pyramidal tracts do not influence the head-dropping test, must be modified somewhat by saying that they do not essentially affect the head-dropping test. Though it is true that cases of marked pyramidal involvement have been seen in which this test was normal, occasionally some modification of it has been seen in pyramidal lesions. But here the downward movement of the head never assumes the same character as that seen in Parkinson's syndrome. It is only somewhat uneven, jerky. However, the problem of the head-dropping test in pyramidal lesions requires further investigation. The minor deviation in the test as seen in pyramidal lesions is infinitely less evident than that seen in Parkinson's syndrome, in which it is so obvious as to be unmistakable. Therefore if in a brain lesion with pyramidal signs the head-dropping test is found as in Parkinson's syndrome, this points to concomitant involvement of the extrapyramidal nervous system.

To sum up: In the head-dropping test, the head of the patient lying supine is suddenly and briskly lifted and dropped by the examiner. A slow hesitant movement or a soft fall, a gentle hitting of the surface, is indicative of a lesion of the extrapyramidal system and constitutes a valuable diagnostic sign in Parkinson's syndrome.

SIDE-EFFECTS OF A PREPARATION OF VITAMIN B₁₂

BY

P. D. BEDFORD, M.D., M.R.C.P.

(From the Cowley Road Hospital, Oxford)

During the course of an investigation involving large numbers of intramuscular injections of a proprietary preparation of vitamin B₁₂ (Bedford, 1951a) side-effects were noticed which warranted further inquiry. This preparation was a vitamin-B₁₂ "concentrate" derived from *Streptomyces griseus* fermentation liquors, and, being both effective and inexpensive, was assuming increasing prominence in the treatment of pernicious anaemia. It was of interest to determine whether the vitamin B₁₂ itself or a contaminant was responsible for these side-effects, and to investigate some factors which may have predisposed to their occurrence.

Method

Three preparations were available for trial: (1) "A" was the proprietary vitamin-B₁₂ preparation referred to above, containing 20 µg. per ml. It is described as a concentrate, being in fact a solution of vitamin-B₁₂ factors derived from streptomyces fermentation liquors by a combination of customary extraction procedures, and is no longer in general issue (J. T. Marsh, 1951; personal communication). (2) "B" was a proprietary preparation of vitamin B₁₂ derived from liver and contained 10 µg. of B₁₂ per ml. (3) "C" was a solution of vitamin B₁₂ containing 20 µg. per ml., derived, like A, from streptomyces culture liquors, but "purified by crystallization and therefore likely to contain a smaller proportion of any impurity" (J. T. Marsh).

At the time of this investigation the proprietary preparation which has replaced A in general issue was not available for trial. It is, like C, a streptomyces derivative purified by crystallization, but is a solution of vitamin B₁₂ (not B₁₂), and its impurities are stated not to exceed 1 part in a million millions (J. T. Marsh, 1951; H. M. Walker, 1951; personal communications).

One hundred people (27 women and 73 men) between the ages of 21 and 90 were injected intradermally with 0.1 ml. of A, 0.2 ml. of B, and 0.1 ml. of C—that is, equal doses of vitamin B₁₂—on the flexor surface of the forearm, and the results recorded at 15 minutes, 30 minutes, and 24 hours. Positive reactors were arbitrarily assessed as those with persistent wheals 5 mm. and more in diameter.

Results

The results are set out in Table I. There were 14 positive reactions to A, none to B, and two to C (both of these being also positive to A).

TABLE I.—Positive Intradermal Tests

		0.1 ml. A	0.2 ml. B	0.1 ml. C
Men	73	9	0	1
Women	27	5	0	1
Total	100	14	0	2

Of the 100 people under test, 52 had received one or more antibiotics within the past five years (49 penicillin, 7 streptomycin, 4 "aureomycin," and 2 chloramphenicol), while 48 denied previous contact with mould products. Table II illustrates the relationship between skin-test positive reactions and previous treatment with antibiotics. Of those

TABLE II.—Relation Between Positive Intradermal Reactions and Previous Antibiotics

Total	52	10 (19%)	2	48	4 (8%)	0

who had previously received antibiotics, 19% were skin-test-positive to A, whereas only 8% of those who had not previously received antibiotics were A-positive.

As the relationship between positive intradermal reactions and general sensitivity phenomena is not absolute, it was decided to estimate directly the proportion of people who might be expected to exhibit side-effects to A, B, and C when these were administered, as is usual, by deep intramuscular injection. Two groups of people were selected, group 1 being the 14 skin-test A-positive reactors, and group 2 being 14 skin-test A-negative reactors. They were injected with 2 ml. of A, 4 ml. of B, and 2 ml. of C—that is, 40 µg. of vitamin B₁₂ in each case—as follows:

Experiment 1: 2 ml. of A to group 1, and 2 ml. of A to group 2; followed two days later by *Experiment 2:* 4 ml. of B to group 1, and 4 ml. of B to group 2; followed two weeks later by *Experiment 3:* 2 ml. of C to group 1, and 2 ml. of C to group 2; followed after a further two days by *Experiment 4:* 2 ml. of A to group 1, and 2 ml. of A to group 2.

The results are set out in Table III. As experiments 2 and 3 yielded no reactions they are omitted from the table; the results of experiments 1 and 4 were identical and so are not set down separately. There were no side-effects to B

TABLE III.—Side-effects to A in Positive and Negative Skin Reactors

or C, but six cases reacted adversely to A. There were two moderately severe reactions (both in group 1), consisting of considerable pain and tenderness at the site of injection, with fever, shivering, and malaise beginning six hours after the injection and lasting 24 hours. Four mild reactions occurred (two in group 1, and two in group 2), consisting of pain and tenderness at the injection site lasting 24 hours.

Table IV illustrates the relationship between previous antibiotic treatment and the occurrence of side-reactions, and is based on experiments 1 and 4 above—that is, on 28

TABLE IV.—Relation Between Side-effects to A and Previous Antibiotics

	Previous Antibiotics		No Previous Antibiotics	
	No.	Side-effects	No.	Side-effects
Men	13	3	6	1
Women	6	2	3	0
Total	19	5 (26%)	9	1 (11%)

people. Of those who had previously received antibiotics 26% developed side-effects to intramuscular injection of A, whereas only 11% of those who had not previously received antibiotics reacted adversely.

Conclusions.—Although the numbers involved in these experiments are too few to be statistically evaluated, the following inferences may be drawn: (1) It is clear that the factor responsible for both the sensitivity reactions and the

side-effects was not vitamin B₁₂ but an impurity present in A, absent in B, and present in traces in C. This substance was therefore probably a carry-over impurity from the streptomyces fermentation liquor (Tables I and III). (2) People who had previously received penicillin or other antibiotics were more than twice as likely to be skin-sensitive and to develop side-effects to the "mould impurities" as those who had not been so treated (Tables II and IV).

Discussion

There is increasing evidence that unusual responses to antibiotic therapy are nearly always the result of acquired sensitivity (Lancet, 1951), and that non-specific hypersensitivity to fungi or mould-products may be responsible for a significant proportion of these unusual responses. The conclusions above imply an antigenic relationship between antibiotics and carry-over impurities in certain vitamin-B₁₂ preparations derived from streptomyces: it is a reasonable corollary that the converse relationship is valid.

In themselves, the side-effects and skin reactions described above, being trivial, would be scarcely worthy of mention were it not that they indicate yet another way in which idiosyncrasy to antibiotics may be acquired. Deaths directly due to this cause are very rare, but it may prove a serious handicap in the management of infections, since people who are idiosyncratic to one antibiotic may be sensitive to all the others (Bedford, 1951b) and reactions may be so severe that antibiotic therapy becomes impossible.

This investigation does not exclude the possibility that preparations of vitamin B₁₂ derived from liver may also contain impurities capable of producing sensitivity phenomena (nor, indeed, that the pure vitamin itself may be capable of doing so); but there is no evidence that sensitivity to liver derivatives implies idiosyncrasy to antibiotics.

Cogent reasons for preferring any preparation of vitamin B₁₂ to liver extracts were: low price, greater purity, relative freedom from side-effects, and the trivial nature of these when they did occur. As, however, there are now available highly purified vitamin-B₁₂ preparations from both liver and streptomyces, against which no evidence of liability to promote idiosyncrasy to antibiotics has been adduced, the use of the cruder mould-derivatives is unjustified.

Summary

Of 100 people 14 were skin-test-positive to a vitamin-B₁₂ concentrate derived from *Streptomyces griseus*, and six suffered side-effects after intramuscular injection.

Two were skin-test-positive to a purer preparation of vitamin-B₁₂ derived by crystallization from streptomyces cultures, and none developed side-reactions to intramuscular injection.

None reacted adversely to a preparation of vitamin B₁₂ derived from liver.

Impurities carried over from the mould fermentation liquor are regarded as responsible for the sensitivity phenomena.

Both cutaneous reactions and side-effects were more than twice as common in people who had previously been treated with antibiotics.

The possibility of inducing idiosyncrasy to antibiotics is advanced against the use of impure preparations of vitamin B₁₂ derived from mould cultures.

It is with great pleasure that I express my gratitude to Mr. J. T. Marsh and Dr. H. M. Walker, of the Medical Department of Glaxo Laboratories Ltd., for supplies of vitamin-B₁₂ preparations and for information concerning them; and to the patients and staff of the Cowley Road Hospital for their co-operation in this investigation.

"EPIDEMIC" ABDOMINAL COLIC ASSOCIATED WITH STEATORRHOEA

BY

MAIR E. M. THOMAS, M.B., Ch.B., B.Sc. D.P.H.

(From the Public Health Laboratory, Edmonton,
London, N.9)

Many specimens of faeces from cases of gastro-enteritis and diarrhoea suspected of being infective in origin are sent to the laboratory for examination. Often a known bacterial or protozoal pathogen is found, or food-poisoning organisms are incriminated; but a number of sporadic cases and a few epidemics remain for which no satisfactory explanation is found. We have observed the occurrence of pale stools and steatorrhea among some of these unexplained cases, and an outbreak of gastro-enteritis of this kind is described here because it suggests the occurrence of a syndrome of infective intestinal disorder which is not generally recognized.

The Outbreak

In December, 1950, a number of cases of diarrhoea occurred in a day nursery accommodating 50 children under the age of 5. The course of events is summarized in the Table. After the tenth day no further cases of

Day of Outbreak	Case No.	Sex	Onset of Symptoms
1	1	M	Diarrhoea during night
	2	F	" and vomiting in morning
2	3	M	" " " "
	4	F	" at midday
	5	M	Severe stomach-ache in afternoon
3	6 to 16		Diarrhoea beginning at various times during the day. Case 13 had also severe vomiting
4	17	F	Diarrhoea
	18	M	Diarrhoea
5	19 to 22		Four of the staff complained of abdominal pain and flatulence with a sensation of "churning up" in the intestines.
6	23	F	Diarrhoea
	24	M	Diarrhoea
	25 to 26		Two more of the staff felt ill
7	27	M	Diarrhoea and vomiting
	28	F	" "
	29	M	Diarrhoea
8	30	M	" "
9	31	M	Vomiting
			Case 6 suffered from vomiting. She had been well for the three previous days
			Case 8 had diarrhoea again. He had been well for the five previous days
10			Case 3, who had been ill for four days and better for four days, developed a second bout of diarrhoea

diarrhoea or vomiting occurred. It will be seen that fresh cases developed over a period of nine days. In all, 25 children aged from 1 to 4 years and six staff were affected—just under half the number of persons at risk. In addition four household contacts of three children (Cases 2, 3, and 6) were affected. These secondary cases developed from two to four days after the onset in the child concerned.

Clinical Picture.—The clinical picture was characteristic. The affected children showed a striking pallor with the onset of symptoms, and pain in the abdomen or vomiting (five cases) was the first complaint. The urgency of the call to stool and the apparent straining were severe, out of proportion to the degree of the diarrhoea; and a few children who cried for their pots failed to pass any faeces. The adults who were affected suffered from abdominal pain, flatulence, and nausea, and felt ill; but no adult had frank diarrhoea.

No case was ill for longer than four days, but three cases relapsed and had a second bout of diarrhoea or vomiting a week after the onset of their first attack. Six of the children had slightly raised temperatures. One child had jaundice, a fortnight after his diarrhoea.

Laboratory Findings

Stool specimens from 24 of the 25 affected children were sent to the laboratory on the first or second day of illness. It was noticed at once that 17 of these were unusually pale in colour, and most were fluid. Fourteen were given careful microscopical study as well as a bacteriological examination; 10 were examined bacteriologically only. The bacteriological examination included a special search for heat-resistant strains of *Cl. welchii*, and for *Bact. coli* of the possibly pathogenic D 433 and "Aberdeen beta" types; but these organisms were not found; nor were shigellae or salmonellae. All organisms isolated were recorded; but not one organism of any kind was common to even a majority of cases. It thus appeared that no help could be obtained from the bacteriological examination; and attention was redirected to the microscopical findings. No cysts, worms, ova, or protozoa had been found, and no leucocytes or red cells; but globules of neutral fat (staining with Sudan) had been seen in 9 of the 14 cases examined microscopically. These globules were mostly from 10 to 30 μ in diameter, and were numerous in every microscopical field.

Castor oil, paraffin oil, and cod-liver oil were considered; but the first two had not been given; and faeces specimens from children from another nursery, in which a similar diet and the same amount of cod-liver oil were being given, did not show this undigested fat.

It therefore seems that steatorrhoea was an abnormality associated with the outbreak of gastro-enteritis described, and that the characteristic stool was pale or putty-coloured, fluid, and acellular, with, in most cases, much undigested fat recognizable microscopically.

Discussion

A great deal of gastro-enteritis occurs in the community, and often no attempt is made to obtain an explanation. When multiple cases occur within an institution, however, a single cause is reasonably suspected and it is usual for some investigation to be made.

In the majority of such outbreaks referred to this laboratory shigellae, salmonellae, or *Giardia* have been incriminated; but in four recent incidents of the kind, including that described above, no pathogen was isolated from the faeces and the circumstantial evidence did not suggest food-poisoning. An additional search for heat-resistant *Cl. welchii* and for *Bact. coli* of types associated with infantile enteritis was without result. It was noticed, however, that the stools of these patients were often of a pale putty colour, and that on microscopical examination leucocytes were almost always absent, however fluid the faeces, while globules of undigested fat were quite often present in specimens from children.

The occurrence of multiple cases of this condition, some of which exhibited fever over periods of four days, suggested an infective agent, but the negative results of many bacteriological examinations imply that the organism, if it exists, is not easily cultivated, and perhaps a virus aetiology should be considered.

The disorder would seem to have affected the digestion of fat in the small intestine, since it started as central abdominal colic with flatulence and was often followed by the passage of pale fatty stools. The absence of leucocytes indicated that there could not have been much inflammation of the large bowel mucosa.

In addition to the minor epidemic incidents referred to, sporadic cases of gastro-enteritis with similar features have been encountered, but in these isolated cases many explanations are possible, and such conditions as subicteric infective hepatitis, idiopathic steatorrhoea, and unsuitable diet have to be considered in diagnosis. It would be of value in such cases, and especially when they occur in outbreaks, to

have a biochemical analysis of the stools, and to examine blood and urine for bile factors. Bile has not been found so far in a few urine specimens from similar cases.

The syndrome can be recognized. Further observations are needed to determine whether it is rare or common, and to throw light on its cause or causes.

DEATH FOLLOWING A BARIUM ENEMA IN A CHILD WITH HIRSCHSPRUNG'S DISEASE

BY

A. JOLLEYS, F.R.C.S.

Research Assistant, Department of Child Health, University of Manchester

It is generally recognized that barium enemata must be given with caution in cases of megacolon, because of the danger of precipitating intestinal obstruction. The following is an account of a case in which a child suffering from megacolon died after a barium enema, but from a different cause.

Case Report

The patient, a boy aged 3 years and 10 months when he was admitted to hospital on November 28, 1949, was the third child of healthy parents. The family history revealed nothing of any significance. There was no previous history of fits in the patient or in the family. He had been constipated since birth and had regularly been given soap suppositories. With this stimulation a hard brown stool was passed every three or four days.

Examination showed that the abdomen was grossly distended and tympanitic. In contrast, his limbs were wasted. His weight was 35 lb. (15.9 kg.). No other abnormalities were discovered. Before a barium enema he was given soap enemata daily. Less than 1 pint (570 ml.) of fluid was given on each occasion without ill effect. His bowel appeared to have been satisfactorily cleared of faeces on the day of the investigation, although the abdomen was still distended.

Four pints (2.3 litres) of barium emulsion was introduced and the x-ray films showed the typical appearance of Hirschsprung's disease with a short aganglionic segment. An attempt was made to siphon back the emulsion without result, and on return to the ward it was noticed that the child's condition was unsatisfactory. He was cold, collapsed, and sweating. In an effort to retrieve the enema emulsion, a soap enema of 1½ pints (850 ml.) was introduced, but this too was retained. The sweating persisted and he began to vomit dark-coloured fluid. About seven hours later he lapsed into coma, became cyanosed, and began to have generalized convulsions. This condition persisted through the night and sedatives were given repeatedly. It was noticed that large quantities of very dilute urine (S.G. 1001) were being passed. Examination of the central nervous system at this stage showed no abnormal physical signs apart from the unconsciousness, dilated pupils which reacted sluggishly to light, and bilateral Babinski reflexes. He eventually died in a convulsion 20 hours after the enema had been given.

Permission for necropsy was not obtained, so the cause of this sudden death cannot be proved with certainty, but it seems probable that it was due to water intoxication.

Discussion

In this connexion Rowntree (1926) demonstrated certain phenomena in man and in experimental animals. If a patient with diabetes insipidus began treatment with pituitrin but did not at the same time limit his excessive water intake

he developed weakness and vomiting. If large amounts of water were given to normal dogs by stomach tube they developed retching, vomiting, and violent convulsions, ending in death. The only abnormality found after death was oedema around the cerebral blood vessels. Rowntree also found that the convulsions could be prevented by cerebral decompression operations.

Helwig, Schutz, and Curry (1935) reported the case of a woman aged 50 who by mistake received 9,000 ml. of water by proctoclysis in 30 hours. She became ill with sweating, vomiting, and pain in the neck. She passed into a stupor about 20 hours from the beginning of the symptoms and died 13 hours later after a series of convulsions. At necropsy the lungs and cardiovascular system were normal; the dura was very tense and the brain oedematous, with convolitional flattening. Microscopy showed perivascular oedema.

More recently, Hiatt (1951) noticed that patients with megacolon suffered from sweating, anorexia, and weakness following enemata. He showed that the rate of absorption of water from the colon was dependent on the intraluminal pressure, hence the symptoms were precipitated by straining, and investigations of the plasma electrolytes revealed that these symptoms were accompanied by a sudden marked drop in the sodium and chloride concentrations.

In the absence of any other satisfactory reason for death, it appears probable that this child died from water intoxication. The weight of Helwig and Schutz's patient is not stated, but if, for the sake of argument, it is assumed to have been 140 lb. (63.5 kg.) the lethal amount of water in her case was 9,000 ml. given in 30 hours. The equivalent amount for a child of 35 lb. (15.9 kg.) would be 2,250 ml. The child here reported received 3,124 ml. in a few hours. The symptoms and signs were those of water intoxication. The possibility of barium poisoning was investigated; no soluble barium salt could be found in the mixture that was used, and the solubility of barium sulphate is so slight that a toxic dose could not be dissolved in 4 pints (2.3 litres) of water.

The danger of water intoxication must be remembered when enemata are given to children with megacolon. The volume of the enema fluid must be limited, and every effort be made to retrieve it. Hiatt suggests using isotonic salt solution, which, if absorbed, will not tend to cause cerebral oedema; but an increase in the circulating blood volume will result, which could conceivably produce pulmonary oedema. He suggests that the fluid could be made hypertonic by adding some innocuous non-diffusible substance, say 7% gelatin.

The symptoms of water intoxication are due to the increase in interstitial and intracellular fluid. Treatment of an established case should aim at causing a shift of this fluid back into the circulatory system. The treatment recommended is the transfusion of hypertonic saline, and the amount of sodium ion that is needed can be calculated if the volume of absorbed water is known.

If circulatory failure occurred owing to a rapid increase in circulating volume a venesection would be necessary.

I wish to express my grateful thanks to Professor W. F. Gaisford for his helpful criticisms.

W.H.O. and the Rockefeller Foundation have sponsored a pilot survey, to be carried out in England and France, on the types of health and welfare workers best qualified to meet the needs of the family (International Hospital Federation *News Bulletin*, March, 1952). The survey has begun in Bedfordshire, and will be extended to London shortly; work is also progressing in France.

Medical Memoranda

Spontaneous Rupture of a Leukaemic Spleen

Although Kaufmann (1929) mentions that a leukaemic spleen may rupture spontaneously such cases are rare enough to warrant being placed on record.

CASE REPORT

A Sinhalese man aged 56 was admitted with the history of pain in the upper part of the abdomen of two months' duration. The pain was continuous and unrelated to meals, but he vomited occasionally after taking food.

On examination he was pale but fairly well nourished. His pulse was 76 and temperature 98.4° F. (36.9° C.). No abnormality was found in the cardiovascular and respiratory systems. There was a hard smooth mass in the left hypochondrium, reaching to the umbilicus, which appeared to be an enlarged spleen. No lymphatic nodes were palpable. X-ray examination after a bismuth meal did not reveal any abnormality in the gastro-intestinal tract. The stomach appeared to be in the normal position, but the left kidney was pushed downwards. The leucocytes totalled 26,200 per c.mm., and the differential count showed 16% polymorphs and 84% lymphocytes. Most of the lymphocytes were mature and belonged to the small variety. No malaria parasites were seen in the peripheral blood.

Diaphragmatic surface of spleen.

As the pain became more severe and was unrelieved by any medication, it was decided to explore the abdominal cavity. This was done two days after admission, by a left paramedian incision. There was a fair quantity of blood in the peritoneal cavity. The spleen was found to be considerably enlarged, and several ruptures exposing the splenic pulp were noticed. The lymphatic nodes at the hilum and alongside the splenic artery were also enlarged. The liver was slightly enlarged, but palpation failed to reveal any nodules. He was given 10 oz. (280 ml.) of blood, and splenectomy was carried out by Mr. R. Anthonis.

A blood count one month after the operation showed: erythrocytes, 3,595,000; Hb, 60%; leucocytes, 30,000 (polymorphs 25%, lymphocytes 69%, eosinophils 6%).

Description of Specimen.—The spleen measured 22 by 18 cm. and weighed 1,800 g. There was an extensive rupture exposing a large area of splenic pulp on the visceral surface and adjacent part of the diaphragmatic surface. Two irregular linear ruptures extended from this area towards its upper border, and a triangular-shaped rupture was seen towards its lower pole. The rupture over the diaphragmatic surface involved almost the whole breadth of the viscus (see illustration). Two linear ruptures extended from the splenic notch towards the diaphragmatic surface. The sectioned surface of the spleen appeared nodular. Localized areas of perisplenitis were found on the diaphragmatic surface. Microscopically the pulp was seen to be overrun with closely packed lymphocytes, which were uniformly distributed, obliterating the Malpighian corpuscles. Numerous mitoses were seen. The lymph sinuses were packed with lymphocytes.

COMMENT

The absence of a history of trauma suggests that this was a case of a rupture occurring spontaneously in a pathologically enlarged spleen. Although the presence of blood in the peritoneal cavity suggests that at least one of the ruptures had occurred prior to operation it is not possible to be certain about the "spontaneous" origin of all the ruptures, as even comparatively mild trauma, which is necessarily inflicted on the viscus during operative manipulation, may be sufficient to cause the rupture of a spleen which is grossly enlarged.

The enlargement of the spleen in this case exceeded that usually seen in cases of lymphatic leukaemia, but the cells in the peripheral blood were undoubtedly lymphocytes, and as they were of the small variety no difficulty was experienced in differentiating them from the cells of the myeloid series.

The absence of infarcts also points to lymphatic leukaemia as being the causative factor in the splenomegaly. The incidence of splenic infarction is much less frequent in lymphatic leukaemia. Lubarsch (1927) records infarcts in only 12.5% of lymphatic cases as against 50% of myeloid cases. There was no evidence of malaria or of kala-azar. It was concluded that lymphatic leukaemia was solely responsible for the splenic enlargement.

My thanks are due to Mr. R. Anthonis, surgeon, General Hospital, Colombo, for the case notes, and to Mr. K. M. M. Michael, of the Department of Pathology, University of Ceylon, for the photograph.

Torsion of Fallopian Tube during Pregnancy

Torsion of the Fallopian tube is in itself a rare condition; only about 120 cases having been recorded in the past 50 years. Records of this condition occurring during pregnancy are even less common. For this reason, and because of its general interest, the following case is reported.

CASE REPORT

A primipara aged 27 was admitted to hospital on April 26, 1951, complaining of abdominal pain. This pain, which was constant and dull in character, was situated in the right iliac fossa and radiated across the abdomen and round to the back. It had been present for approximately 60 hours, originally awakening her in the night. During the previous six hours it had become more severe. Vomiting occurred on two occasions on the first day of her illness. Her bowels had been constipated and she had nocturia and painful micturition for two days. No previous history was obtained of a similar pain or of any previous illness. Her last menstrual period started on September 12, and she therefore appeared to be 32 weeks pregnant. Her pregnancy up till then had been uneventful. She had been attending an antenatal clinic regularly.

On examination her tongue was furred. She was tender above the right inguinal ligament, although not markedly so. There was no tenderness in either loin. The size of the uterus appeared to be much in advance of her dates. Rectal examination, although causing discomfort, was negative. On vaginal examination a soft mass was felt in the right iliac fossa outside the uterus.

On admission the temperature was 99.4° F. (37.4° C.) and the pulse 80. In four hours her temperature had risen to

100.4° F. (38° C.) and her pulse to 100. A catheter specimen of urine revealed an acid reaction with a trace of protein. The deposit contained a few pus cells and a very occasional red cell. A provisional diagnosis of acute appendicitis was made and operation was decided upon.

The abdomen was opened through a right pararectal incision. A large mass was palpated in the right iliac fossa, and the right Fallopian tube was gangrenous in its whole extent. Its removal was impeded by the size of the uterus, and its congestion caused bleeding difficult to control. A gauze pack was inserted into the right iliac fossa.

The surgical post-operative course was uneventful and the gauze was removed on the second day. Morphine was given to prevent the onset of labour, but on the fourth night after operation labour began. The patient was transferred to a maternity unit four days after operation. At this time labour was well advanced and the membranes had ruptured. The cervix was dilated to two fingerbreadths and the head was in mid-cavity. A Danby belt was applied to give support to the abdominal wound. Labour progressed slowly, and four hours later the cervix became fully dilated. An episiotomy was performed because of delay in the second stage due to a rigid perineum, and a live male infant weighing 8 lb. 2 oz. (4.2 kg.) was delivered.

The puerperium was uneventful, and both the abdominal wound and the episiotomy healed well. When seen one month later both patient and baby were well.

Pathology.—The right Fallopian tube measured about 3 by 2 in. (7.5 by 5 cm.) and was very congested. A single twist had occurred at the proximal end of the isthmus. Sections showed complete infarction.

COMMENT

Only two cases of torsion of a normal tube in pregnancy have previously been reported in the English literature (McKerrow, 1934; Caldwell, 1949). Twisting of a hydrosalpinx or a haematosalpinx during pregnancy occurs more often. Green-Armytage (1929) and Sheldon (1936) reported cases of torsion of both the Fallopian tube and the ovary during pregnancy; but in our case the ovary was not involved. All cases reported were operated upon as acute appendicitis, and thus laparotomy is necessary for diagnosis. Pyelitis and twisted ovarian cyst are other conditions that have to be considered in the diagnosis.

It was noticed that the site of pain was low in the right iliac fossa. The pain of appendicitis in pregnancy is usually higher up in the abdomen owing to the displacement of the appendix by the enlarging uterus. Because of this an incision was made over the site of maximal tenderness.

It is obvious that the patient was mistaken in her dates. One must assume from the weight of her child that the pregnancy was considerably more advanced than had been thought. In the two cases previously referred to the condition occurred at about the sixth month and pregnancy then went on to term. Our patient was stimulated into labour. The good ultimate result in both patient and child is noteworthy.

We wish to thank Mr. S. B. Chambers, senior surgeon, Royal South Hants Hospital, for his permission to publish this case; Mr. R. W. Knowlton, obstetrician; and Dr. H. H. Gleave, pathologist, for his report on the specimen.

Reviews

UROLOGY OF CHILDHOOD

The Urology of Childhood. By T. Twistington Higgins, O.B.E., M.B., Ch.B., F.R.C.S., D. Innes Williams, M.D., M.Chir., F.R.C.S., and D. F. Ellison Nash, F.R.C.S. (Pp. 286; 136 figures. £2 5s.) London: Butterworth and Co. 1951.

The authors have indeed made an outstanding contribution to urology by presenting, in the light of the most recent advances in this specialty, the wealth of clinical and pathological material which has been collected at "Great Ormond Street." A summary of the physiology of micturition serves as an admirable introduction to the aetiology and management of incontinence and enuresis as shown by investigations into habit, by cystometry, and by electroencephalography. The account of the management of infections of the urinary tract includes much valuable information on the newest sulphonamides and antibiotics and on their side-effects. The authors then consider the association of medical and surgical diseases of the kidney jointly as they affect the renal parenchyma and hence the biochemistry of the body. The chapter on embryology not only gives information on many of the most controversial points in the development of the urinary system, but helps to explain very clearly congenital abnormalities of the upper and lower urinary tract. The effects of urinary obstruction are discussed at three levels: vesical retention due to obstruction at the bladder neck, posterior urethral valves, and abnormalities of the urethra; obstruction at the uretero-vesical level in the various types of mega-ureter; and obstruction of the upper urinary tract causing hydronephrosis. Each chapter is illustrated by photographs of specimens and by radiographs from the unique collection in the museum of that hospital. Likewise, in the chapters on urolithiasis, urinary tuberculosis, and neoplastic disease the authors make admirable use of the immense amount of pathological and radiological material at their disposal. The book is also a practical one in that the authors give detailed descriptions of the technique of investigation, management, and operative procedure.

This work will be of the greatest assistance to all who require an authoritative textbook on the urology of childhood and also to those wanting to obtain references to the more recent advances in this specialty.

J. E. SEMPLE.

CLEFT LIP

Cleft Lip and Palate. By W. G. Holdsworth, F.R.C.S. Ed., F.R.C.S. With foreword by Sir Harold Gillies, C.B.E., F.R.C.S. (Pp. 126; 87 figures. £1 15s.) London: William Heinemann Medical Books. 1951.

Textbooks of surgery tend to fall into two distinct classes—those whose aim is to help candidates through examinations, and those concerned with the actual treatment of cases. In the former it is necessary to set out all known varieties of treatment and hypotheses of pathology without recommending one or attacking others; for who can say whether the examiner will approve of a definite opinion on one side of a debated question? Because so many points of view have to be stated, such a book has to treat each one very shortly or become of an impossible length. The second type of textbook tends to be argumentative, opinionated, and detailed, confining its remarks on all theory and practice outside that of the author to pointing out how wrong they are. The dust cover of Mr. Holdsworth's book suggests the category to which it belongs by stating that "questions on these topics constantly arise in Fellowship examinations," and that the operations described in various parts of the world are described and classified. In consequence his book invites criticism from the point of view of the examinee rather than that of the operating surgeon.

In the absence of any guidance from textbooks of anatomy or physiology on the actual mechanism of

closure of the palate, a dispute exists between those who maintain that the muscles admittedly existing in this region can close and open the nasopharynx and those who have discovered a hitherto overlooked sphincter of abnormal contractility which performs this function. Mr. Holdsworth evidently holds the first view, and states it alone; but anyone omitting to mention the second is running a grave risk in an examination. A similar fundamental point is how exactly the constituents of the lip join to give it the very definite shape and markings seen in the newborn infant. On this again there is no guidance from the embryologists, nor from this book; but the views of Veau and others should be stated, for it is surely logical first to identify the process that has failed before trying to complete it.

Various formulae for closing single and double clefts of the lip are set out, but the series of drawings would be rather exasperating to an actual operator. This is because the clefts are all shown before operation with a symmetrical pair of nostrils, and the results of various classical flaps and zigzags as the same unvarying normal shape of lip with a perfect cupid's bow. It is an undoubted fault of our present system of surgical education that there is no way of ensuring that (in Army parlance) "this practice will now cease"; though anyone who has to do much of this work knows that some of the formulae here reproduced without comment will set him almost insoluble problems if applied by a trusting general surgeon. The difficult and chancy Abbé operation, for instance, a fine example of which is illustrated here, is one that corrects a man-made deformity, not a congenital one. On the question of the displaced premaxilla in double clefts, there is no definite statement upon whether or not the vomer is of normal length, with a suture-line dividing it from pre-vomerine bone, though this is a question of fact and not of opinion. It is also hard to make out whether or not the premaxilla is to be finally preserved, and if so in what position.

One ends the study of this interesting book hoping that Mr. Holdsworth will abandon in subsequent editions the attempt to help candidates through examinations, in which in any event they will probably be questioned by surgeons whose experience lies in the abdomen, and that he will concentrate upon the clear statement of his own personal opinions and experience. A point on which he might well make a break with the traditions of publications on plastic surgery is to forswear lipstick, retouching, and smiles in illustrations of final results.

DENIS BROWNE.

THE XANTHOMATOSES

Les Xanthomatoses. By A. L. Froehlich. (Pp. 312; illustrated. No price.) Brussels: Les Editions "Acta Medica Belgica." 1951.

This is an important monograph on the xanthomatoses. Like Thannhauser, Dr. A. L. Froehlich, of Antwerp, divides xanthomatoses into those with and those without hyperlipaemia. The first part of the book is on the former, the second part on the latter. Then come the general conclusions (pp. 261-71), a detailed account of 25 original cases (pp. 272-311), and an iconography with 46 histological figures.

Part I is divided into chapters on (1) essential xanthomatosis; (2) essential hyperlipaemia; (3) xanthomata in the course of hypothyroidism; (4) diabetic xanthomata (with a short account of so-called "necrobiosis lipoidica"); and (5) the complicated subject of hepatic xanthomata. Part II, on the xanthomatoses without hyperlipaemia, is divided into chapters on (1) naevo-xantho-endothelioma (McDonagh); (2) intestinal lipodystrophia (Whipple); (3) disseminated xanthomata, including an account of lipoidic proteinosis (Urbach-Wiethe); (4) the Hand-Schüller-Christian disease, and its differential diagnosis including the whole subjects of lipoid-granuloma, xanthomatous changes in fatty tissue, and the xanthomatosis of granulomata and neoplastic tumours.

The author discusses all these subjects and points out that in regard to some questions further observation and the collection of clinical or experimental data are required. Naturally the work of van Bogaert, Scherer, and Epstein on a "Cerebral Form of Generalized Cholesterinosis" (1937) is specially considered. Among the extensive references to much of the older as well as the newer literature the reviewer was much interested to find a case of his own mentioned on p. 207. It was that of a man, aged 37, with diabetes insipidus, who died of pulmonary and laryngeal tuberculosis. At the post-mortem examination a xanthomatous lesion of the posterior part of the pituitary body was found, but there was no other evidence of the Hand-Schüller-Christian disease. Doubtless Dr. Froehlich is right in regarding the case as a very incomplete example of the Hand-Schüller-Christian syndrome. The original description by Parkes Weber and H. Schmidt was published in *Amer. J. med. Sci.*, 1916, 152, 892.

Dr. Froehlich's book should be kept for reference by all those specially interested in the xanthomatoses and the various theories connected with the subject.

F. PARKES WEBER.

APPLIED ANATOMY

Angewandte und Topographische Anatomie. By Professor Gian Töndury. (Pp. 416; 369 figures. M. 70.) Stuttgart: Georg Thieme. 1951.

In this volume the author aims at combining topographical anatomy, which describes the structure and relationships of the different organs and organic systems of the human body, with applied anatomy, which describes the practical application of this knowledge. Moreover he aims at providing both a textbook for the student and a work of reference for physician and surgeon. That he succeeds in covering this vast field in a moderate compass and in a most brilliant manner is a tribute to the genius of himself and his assistants.

The author is brief, clear, and to the point, and succeeds in including details whose value has only recently appeared in the actual practice of medicine and surgery. I might mention the attention directed to the autonomic nervous system and to the precise anatomy of the intervertebral disks. Short but adequate accounts of morphology and development will be valued by the student as enabling him to understand relationships which would otherwise be incomprehensible.

But the real charm of the book is in the drawings, which are a sheer delight to study. They fall into two groups—line drawings in the text and plates on separate pages. The former are remarkable for their simplicity, appositeness, and perfect draughtsmanship, and indicate close co-operation between the author and his artist, Fräulein Emden. But the plates are supreme examples of achievement in a very specialized field. The artist, Paul Winkler, was himself a medical student, and his drawings show an understanding unattainable by a layman however great his artistic skill. They are from dissections specially prepared and admirably conceived, and are drawn with a supreme technical skill which focuses attention on essential detail while giving an adequate and harmonious background. They are all good, but two drawings of the roots of the lung, one of the posterior mediastinum, one of the abdominal oesophagus, and an enlarged drawing of the inner ear stand out as really superb examples both of representation and of production.

I would suggest that in a future edition a chapter should be added on the anatomy of the child, for the differences are important, and although many are well recognized, as in the cranium and the hip, others are not so well known. For example, the peripheral nerves in a child are almost as large as those in an adult, which is occasionally of great surgical importance. But these are small matters, and the author and his assistants must be congratulated on an achievement which is worthy of the great medical school of Zurich. It will be valued by all who have an interest in the anatomy of the human body.

HENRY SOUTTAR.

INFLAMED INDIVIDUALISM

Between Life and Death. By Harley Williams. (Pp. 288. 16s.) London: Jonathan Cape. 1951.

From John Aubrey through Samuel Johnson to Lytton Strachey the English biographical essay has a long and distinguished history. For the successful practice of this art it is essential that there should be some link between the chosen subjects and some definite plan in each essay. It is here that Dr. Harley Williams's book, good as it is, falls short of success. In a book devoted mainly to the great pioneers of medical research it is as disconcerting to discover Mrs. Eddy in the gallery ("Que faites-vous là, Mary Baker?") as it would be to see Joanna Southcott seated on the bench of bishops; and in an essay concerned with Joseph Lister to find five pages devoted to Lawson Tait is as surprising as it would be to be offered a cigar by the local bookmaker in a meeting of the Society of Friends. Congregations should be congruous, and the flock, particularly when hand-picked, should be of one feather.

If the reader does for himself what the author has failed to do and reads successively the essays on Hunter, Pasteur, Lister, Freud, Ehrlich, and Banting, he will reflect how diverse were the personalities and how various the paths of these remarkable men. They share but one quality—an exclusive intensity of concentration—for, as Emerson wrote, "the excellence of each is an inflamed individualism which separates him the more." These essays are squarely based on the important source books, and it is their merit that they impel one to learn more of their subjects. I am grateful that the chapter on Frederick Banting introduced me to Lloyd Stevenson's biography, the unique story of a man with a mind unprepared for his moment of genius.

Harley Williams is a master of narrative, but occasionally his meaning is obscured in a flurry of words, as when he writes that his sketches are to be judged "as flashes of an old and very remarkable design which is likely to flower again in endless fecund forms." In fact, there are as extraordinary fish in the sea as ever came out of it.

D. V. HUBBLE.

ORTHOPAEDIC NURSING

Orthopaedic Nursing. By Mary Powell, S.R.N., M.C.S.P. (Pp. 400; 210 figures. £1 5s., plus 10d. postage.) Edinburgh: E. and S. Livingstone. 1951.

This book, which is dedicated to the memory of the late Dame Agnes Hunt, calls for nothing but praise, for within its covers will be found all that the nurse need know about orthopaedic nursing technique. The text is clear and concise, and the book is generously illustrated with excellent photographs. The emphasis throughout is on splintage and nursing care, and the description of surgical treatment and operations is rightly reduced to a minimum.

It is difficult to single out individual chapters for special mention, but those on plaster-of-Paris technique and on the care of the various types of bone and joint tuberculosis are particularly good. The insistence of Dame Agnes Hunt that there should be no polished floors in orthopaedic wards is noted with approval. It is a pity that all orthopaedic matrons and sisters do not follow this rule. The chapter on the preparation of the patient for examination of the various joints should be studied by nurses doing their general training. The book concludes with an excellent chapter on aftercare by Miss Mona Williams.

J. S. BATCHELOR.

For nearly half a century *Black's Medical Dictionary* (by the late John D. Comrie and Dr. William A. R. Thomson; A. and C. Black, 30s.) has endeavoured to "give information in simple language upon medical subjects of importance and general interest." Twenty editions since 1906 are proof of its reliability as a medical work for the lay public. It is more than a dictionary, for it includes much anatomical description and physiological explanation, fortified by over 400 text illustrations and 16 plates. The whole of the text-matter has been reset.

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY MARCH 29 1952

FORTY MILLION POUNDS

On Tuesday afternoon, as the *Journal* was going to press, the Minister of Health, Mr. Harry Crookshank, announced in the House of Commons the award of Mr. Justice Danckwerts, the Adjudicator. He stated that the award would mean increases for the years previous to and subsequent to 1950-1. "While, as I say," he observed, "the full calculations have yet to be made, I feel I should inform the House that in very approximate terms this may involve an additional charge on the Exchequer of as much as £40m. in the coming financial year to cover the period back to July 5, 1948. . . . It will be necessary to seek a supplementary Vote for this additional amount."

Thus, nearly four years of discussion, controversy, and protracted negotiations on the remuneration of general practitioners have come to an end with the award of Mr. Justice Danckwerts, the adjudicator appointed by the Lord Chancellor. The medical profession decided to take part in the National Health Service on the clear understanding from Mr. Bevan that their claim for payment could be negotiated immediately after July, 1948. The outstanding point left unsettled was the "betterment" factor. The Spens Report recommended that what general practitioners should have received in 1939 should be scaled up in terms of the altered value of money and in relation to the changed earnings of other professions. In deciding the size of the central pool the Ministry of Health arbitrarily fixed on a betterment factor of 20% on net incomes (that is, after deduction of practice expenses)—something which the profession never agreed to and never accepted. As our correspondence columns have shown throughout these four years, the injustice of this situation has rankled in the minds of general practitioners, and with good cause. With much less cause, but perhaps understandably, some have laid the blame for the delay on those responsible for presenting the profession's case.

Details of the award and a report of the proceedings are given in this week's *Supplement*. Mr. Justice Danckwerts's award brings to an end one chapter in the history of the N.H.S. He has applied for the year ending March 31, 1951, a betterment factor of 100% to the 1939 figure for what general practitioners, in the view of the Spens Committee, should have been receiving then. The amount actually paid for that year was £41.533m.: Mr. Justice Danckwerts's awarded

figure is £51.252m. This means that the central pool from which general practitioners were paid on a capitation basis is for 1950-1 to be increased by just under £10m. For 1948, the first year of the operation of the N.H.S., Mr. Justice Danckwerts has recommended a betterment factor of 85%. The factor for 1949-50 will presumably lie somewhere between 85 and 100%, to be determined on the basis of Mr. Justice Danckwerts's awards. Similarly, the same process will be applied to the figure for 1951-2-3. The important point is that general practitioners will receive additional payment back to 1948.

The medical profession's case has been presented so consistently and so cogently that they have gained other and considerable points of principle. First and foremost, Mr. Justice Danckwerts has based his award not on the population but on the number of doctors in the National Health Service. Though this is a logical application of the Spens Report, which sought not to determine a figure for the central pool but to recommend what ranges of income doctors should receive, it was opposed by the Ministry of Health. Another point of variance between the B.M.A. and the Ministry was the inclusion of interest on compensation in their estimate of doctors' total incomes. This again would seem to be, on common-sense grounds, untenable, and Mr. Justice Danckwerts has excluded this figure from consideration, and also the amount of the inducement fund, in his determination of the size of the central pool. As those who have followed the tortuous discussions between the B.M.A. and the Ministry know, there has been disagreement on the percentage for practice expenses. Mr. Justice Danckwerts has accepted the B.M.A. figure of 38.7%, although he adds that he has not "accepted entirely the figures to which this percentage should be applied."

Both the B.M.A. and the Ministry of Health agreed in advance to accept the award of the adjudicator, but it is Parliament which has, and must have, the control of the public purse. The amount of money to be distributed on the basis of the award is considerable, especially as payment will have to be made retrospective to 1948. There can be no doubt that during the past four years the just claims of general practitioners have received growing support both in the Press and in Parliament. It may even be argued that the long delays in negotiation, which have been no fault of the B.M.A., have turned out to be beneficial. This delay has at least allowed public opinion—always slow moving—to turn in sympathy towards the hard-working general practitioner—a sympathy which has found its echo in the House of Commons. What is fundamental to the whole case is the final acceptance of the recommendations of the Spens Report. The Spens Report laid down a standard of living for an important section of

the community, and though the Ministry of Health accepted this in the word its arbitrary decision on a betterment factor of 20% on net incomes, applied to a pool of money based on population and not on numbers of doctors, showed that it did not accept it in spirit. It must be stressed again that both sides entered adjudication on the understanding that they would accept the decision "subject to the overriding authority of Parliament." In the future the extra money awarded will be distributed according to a scheme to be agreed by the Working Party, the G.M.S. Committee's representatives on which will act on the authority of the Conference of Local Medical Committees.

No doubt there will be a few voices protesting that the B.M.A. should have got the betterment factor of 120% claimed for 1951. If such there be, they will have ignored the essential feature of arbitration, which is arbitrament on evidence given by two sides to reach a fair and just decision. But we are confident that the great bulk of the profession will acclaim the efforts of those who have conducted these negotiations on their behalf. These efforts have been brought to a successful conclusion by first-class teamwork and by the able presentation of the profession's case by Mr. Frederick Grant, Q.C., and his colleagues. The burden of the work has fallen, in particular, upon Dr. S. Wand, Chairman of the G.M.S. Committee and Chairman of the Representative Body, and upon Dr. D. P. Stevenson, Secretary of the G.M.S. Committee and Deputy Secretary of the B.M.A. Those who have joined with them in this arduous task will not hesitate to acclaim their services.

The additional money to be paid in retrospect back to 1948 can be distributed only in accordance with the then method of distribution. Future payments will be on the basis now being discussed with the Ministry of Health by the joint Working Party set up to examine the distribution of general practitioners' remuneration. The Working Party's aim is to secure the best possible medical service for the public, to safeguard the standard of practice by discouraging unduly large lists, to improve the position of those practitioners now least favourably placed, to make it easier for new doctors to enter practice, and to stimulate group practice.

Now that the controversy on finance between the B.M.A. and the Ministry of Health has come to an end with the award of the adjudicator they will be able to tackle these and other problems in a spirit, we may hope, of co-operation and mutual respect. Both, after all, have a common aim, and that is to provide the best possible general medical service for the public and to ensure that in the achievement of this those providing the service will be able to do

so with freedom from financial anxiety and the feeling of contentment that arises from a just treatment of their claims. The problems to be solved are many and urgent, and towards the solution of these the General Practice Review Committee of the B.M.A. will make an important contribution. In what should be a new spirit of confidence and satisfaction the medical profession will the more easily turn its energies into fulfilling the intention of the B.M.A. as expressed by the then Chairman of Council, Dr. H. Guy Dain, in a letter to *The Times* in June, 1948, in which he said, after pointing out difficulties and deficiencies: "But in spite of all this, I believe I speak for the overwhelming majority of the medical profession when I say that there will be no shortage of good will on the part of the profession and that it will seek to make the new public service the best which is humanly possible under present circumstances. . . . Only the best is good enough for the public service, and we shall do our utmost to provide it."

RETROLENTAL FIBROPLASIA

If anyone doubts that diseases hitherto unexplained are more likely to arise from a set of interlocking factors than from a single cause let him study the literature on retrolental fibroplasia. There he will find interpretations which, though simple and at first acceptable, soon broke down under the impact of new facts. Retrolental fibroplasia was originally assumed to be a congenital defect, but this point of view was contradicted by emergence of the blindness in infants who, having betrayed no ophthalmoscopic abnormality on examination soon after birth, later developed the characteristic fundus changes. When reports of retrolental fibroplasia began to multiply, many people thought that modern advances in the care of prematurely born babies accounted for the increase. In other words, the potential victims of former times had not survived long enough to develop the disease. Such an explanation was manifestly insufficient, because very few cases appeared in Switzerland, a country in which the premature infant is tended with great vigilance. During the discussion on Reese's¹ paper at the last International Congress of Ophthalmology Franceschetti and Blum (Geneva) both testified to the rarity of retrolental fibroplasia in their country.

Hopes were raised a few years ago by the work of Owens and Owens,² who claimed that prophylactic administration of vitamin E had prevented retrolental fibroplasia in prematurely born babies of low birth-

¹ *Proc. XVI Int. Cong. Ophthalm.*, 1950, 445.

² *Amer. J. Ophthalm.*, 1949, 32, 1.

³ *Ibid.*, 1951, 34, 1.

weight, whereas numerous victims were found among a series of similar subjects not receiving this substance. Several observers failed to obtain this result when they made controlled investigations in the hope of conferring protection with vitamin E, and it must be admitted that no immediately decisive cause or cure of retrolental fibroplasia has yet been identified. Prematurity and reduced birth-weight are of obvious aetiological significance, but evidently they are not the only factors, otherwise the incidence of the disease would roughly correspond in the large groups of cases which have come under scrutiny. The figures, however, show wide discrepancy, not only between different countries but also between separate regions of the same country. Nor do the results of therapy seem consistent. Some authorities have claimed remarkable success from the use of A.C.T.H., and others have found this drug ineffective. Unless the problem of aetiology is solved, it seems doubtful whether retrolental fibroplasia can ever be prevented or arrested, because the chances of discovering effective empirical remedies must surely be remote.

Meanwhile vivid clinical descriptions have been published, and premature infants have been exhaustively scrutinized to ascertain the earliest ophthalmoscopic signs. All the resources of morbid histology have been mobilized, especially by Reese and Blodi,³ whose beautiful illustrations and clear account of the disease deserve close study. Among paediatricians and ophthalmologists retrolental fibroplasia has to some extent usurped the attention lately directed upon toxoplasmosis and rubella. General practitioners are closely concerned with the problem, although they seldom have the opportunity to see retrolental fibroplasia in its earliest stages because the sufferers are usually assembled in special units for premature infants. It is hoped that the questionnaire recently launched by the Medical Research Council will gather helpful information, and certainly the records of maternity departments, premature infant centres, and ophthalmic units are being sifted with care. Dr. B. A. Bembridge and the other members of a research team in Oxford have supplied a helpful review of retrolental fibroplasia elsewhere in this issue, as well as adding further observations of their own. They rightly draw attention to the differences between infantile and adult ocular fundi, and to the fallacies that may be perpetrated by those who ignore these differences. Although they have to admit that the cause of the disease remains a mystery, their work will perhaps not be in vain. Unless the problem is solved by a flash of that intuitional brilliance with which clinicians have often illuminated medicine in former times, many other paths of investigation will have to be followed before this new scourge can be understood and suppressed.

MENTAL HEALTH RESEARCH FUND

In research into mental disorder the fields of study stretch out invitingly on every side; and in the present state of knowledge it is exceedingly difficult to forecast which would be the most profitable to explore. Speculation on these matters is rather like divination, as Professor Aubrey Lewis said at a conference in Oxford last week, but he added the warning that direct attack on problems which seem to be most urgent are not necessarily warranted if contingent knowledge and methods are not ripe. It follows that in this branch of medical research the sharing of knowledge, leading to its integration, is of exceptional importance. The pressing need for integration can be judged from the fact that "in the relatively restricted sphere of electro-encephalography alone there are now a little over three papers a day being published, and in all the subjects which are relevant to the proper orientation of a neurophysiologist in his problems there cannot be less than 12 papers a day."¹ The psychiatric research worker trying to keep up to date with all the relevant literature therefore has an enormous task, and any opportunity to take stock must seem to him particularly welcome.

Such an opportunity was most agreeably given at the important conference held at Magdalen College, Oxford, last week. It was organized by the Research Committee of the Mental Health Research Fund, being its first project. The Fund, the purpose of which is "to promote, finance, and encourage research on mental health and disease," came into being in 1949, a very tangible sign of the growing pressure of public opinion that more should be done to prevent mental ill-health—which in terms of money alone probably costs about £100m. per year. It is all to the good, therefore, that laymen and women have joined with medical men and women to administer the Fund and to consider what the aims of mental-health research should be. In fact the Research Committee of the Fund has a lay chairman, Sir Geoffrey Vickers, V.C., who also most successfully took the chair at the Oxford conference, undeterred by the abstruse and highly technical nature of some of the discussions. A certain uneasiness about the language of psychiatry was apparent. As Professor MacCalman observed, the uninitiated show justifiable irritation when they find common words being given special meanings.

The terms of reference for the Conference were wide: "What are the ignorances which to-day principally hamper our understanding of the nature, prevention, and cure of mental illness? What advances

¹ Bates, J., in a paper presented to the Conference.

² The *Proceedings* of the Conference will be published this autumn by Blackwell Scientific Publications, Ltd., Oxford.

in research are most likely to remove these and so help to reduce the population of mental hospitals and institutions for delinquents?" Among those who discussed these questions were anatomists, physiologists, neurologists, neurosurgeons, neuropathologists, psychiatrists, psychologists, biochemists, pharmacologists, enzymologists, and sociologists. Broadly speaking, the psychiatrists were inclined to dwell on the enormous gaps in knowledge. Dr. Eliot Slater, for instance, remarked that psychiatry is nearly all "ignorance," and Professor MacCalman, in the opening address, emphasized that there was not yet any commonly agreed broad formulation of aetiological principles in psychiatric illness. Dr. Ström Olsen also spoke of our ignorance of the fundamental physiological and neuropathological processes in the brain, and Professor Aubrey Lewis of the neglect in this country of the vital statistics of mental illness, adding that little information is available about the history of patients with various mental disorders after they have ceased to be under medical care. The specialist research workers, on the other hand, justifiably enthusiastic about their new instruments and techniques (Professor A. Kennedy suggested that we were now in the golden age of methods and instruments), were able to show how the results of their investigations were leading to new concepts of mental health and to efforts to relate human and animal behaviour with biochemical and electrophysiological findings.

In anatomical studies designed to throw light on brain function, the so-called primitive elements in the human brain have until recently been neglected. But, as Professor Le Gros Clark told the Conference, these regions of the brain, which include the hypothalamus, are now known to be closely associated with emotional reactions of one sort or another, and further detailed research on the thalamic-reticular system should be rewarding. Dr. G. W. Harris, speaking of the nervous control of the secretions of the pituitary gland, mentioned the effects of emotional stimuli, and suggested that there might be a place for the localized application of electric stimuli to the hypothalamic region in certain psychotic patients. The forging of a link between neuro-anatomy and neurophysiology on the one hand and psycho-analysis on the other was mentioned hopefully by Dr. John Bowlby, who pleaded for neuro-anatomical studies on very young children and referred to the fact well known in embryology that the growth of cells is influenced by the particular environment in which they are at a particular phase of development. Dr. Bowlby also showed how studies of animal behaviour can throw light on man's social responses, whether normal or abnormal. It remains to be seen whether

it will be possible to detect physical changes in the central nervous system when social responses go awry. But, as Dr. D. Richter reminded the Conference, the invention of new tools of research must not lead us to expect too much from the chemical and physical approaches towards the solution of psychiatric problems.

Much was said at the Conference about animal experiments, Professor R. W. Russell giving an illuminating account of experimental neurosis, but some doubt was expressed about the significance of these experiments to human behaviour—Professor Sandford, of Berkeley, California, asking the very pertinent question: What is the *normal* reaction of animals submitted to stressful situations? It was generally agreed that in the end experiments of this sort would have to be tried out on human subjects.

Many suggestions were made at the Conference about future research. There was strong support for Professor Aubrey Lewis's statement that research on the family must continue to be of prime interest. Professor T. S. Simey suggested that relationships between certain sorts of behaviour and certain sorts of family structure should be investigated, and Dr. J. M. Tanner, the honorary secretary of the Fund's research committee, pointed out how valuable would be the help of general practitioners in research on the behaviour and physiology of families. Supporting this, Professor Kennedy said there was still a need for kindly research—research in practical means of being kind to patients. In most of the fields of research into mental disorders there is no lack of material, but the neuropathologists complain of one serious shortage—brains from patients who have recovered from leucotomy and similar operations. The importance of these brains to research is obvious, and with the co-operation of general pathologists it should be possible for neuropathologists to examine many more of them than they do at present.

In an admirable and eloquent speech at the end of this encouraging and stimulating Conference² Sir David Henderson said it was still of the first importance to improve the status of psychiatry in the eyes of the medical profession as a whole. Fifty years ago the outlook of psychiatry was bounded by the wall of the mental hospital, but now psychiatry was entering a new era of activity—a fact which was plain to all those fortunate enough to attend the Conference. The object of research is no longer limited to finding new methods of diagnosis and treatment: the high ideal that can now be set is, as Sir David put it, to improve man in his social setting and so to obtain a saner world.

HEALTH SERVICE ESTIMATES

Once again the financial limit on the cost of the Health Service has been maintained. The estimates for 1952-3 published at the end of last week show a total net cost to the taxpayer of £402.3m., but the limit of £400m. imposed by three successive Chancellors has not in fact been exceeded. The cost of the Health Service as such has been kept down to £392m., compared with £398m. in the year just ending. The balance of £10m. is accounted for by civil defence.

The rise in prices in the last 12 months has been much greater than in the previous year. If allowance is made for this the cost of the Health Service has actually been reduced by a much greater amount than £6m. But the reduction is being imposed mainly by new raids on the patient's purse rather than by cutting the budgets of the various branches of the Health Service. Thus, instead of £392m., the estimated cost of the Health Service would have risen to about £420m. in the coming financial year had it not been for the savings effected by the proposed charges.

The prescriptions charge is estimated to bring in £7½m., and the charge for dental treatment, including the existing charge for dentures, about £11m. The existing charge for spectacles is estimated to bring in nearly £5. This, incidentally, is only slightly higher than the estimated receipts in the present financial year, when the charge was in force for only nine months.

It has been said that the introduction of a charge had a deterrent effect on the demand for spectacles, and the new estimates of the cost of the supplementary ophthalmic service seem to bear this view out. In any case, demand was falling from the high levels of the first two years of the Service. The gross estimate is now only £11m., compared with about £28m. in 1950-1. Unfortunately this is not true of the pharmaceutical service, the cost of which according to Mr. Crookshank is at the moment running at the rate of over £50m. a year. Here again the charge will probably act as a deterrent, for the estimates show a gross cost, before allowing for the proposed charge, of £47½m.

By keeping the net total cost of the Health Service down to £392m. Mr. Butler has a slightly bigger margin in hand than Mr. Gaitskell a year ago. On the other hand, the Bill introducing the new charges has been considerably delayed, and will now not come into force as soon as had been intended when the estimates were drawn up. This means that the receipts from the charges will be less than these estimates. It has also been reported that during the

delay the Bill has been modified and further exemptions from the charges proposed. As the Bill was due to have its Second Reading on Thursday after we had gone to press, these reports have presumably been confirmed or denied, and if true the effect on the estimates explained.

In any case, slightly bigger as this year's margin is, it still leaves very little balance if prices continue to rise as rapidly as they have done. And the hospitals, which have come off best in the new estimates by obtaining an increase of about £20m. in their budgets, are nevertheless far from satisfied. In a time of rising prices they are hard put to it to maintain their existing services, much less expand them. Inflation hits them in the higher prices for food, fuel and power, drugs, and equipment, and in the increases that may be granted in wages and salaries to offset the higher cost of living.

How long can the uneasy financial stability of the Health Service continue? If prices continue to rise, can the Chancellor repeat his policy of allowing the Service roughly the same amount of resources at the new prices by imposing more, or heavier, charges on patients? The proposed charges are unpopular, and it will not be easy for him to maintain the hospitals by mulcting still further the patients who need a bottle of medicine or dental treatment.

On the other hand, if he does not do this, he will have to spread the burden of the higher financial cost on the general body of taxpayers; and heavier taxation would be contrary to the policy proclaimed in this year's Budget of restoring incentives to harder work and higher output. Nor would taxation be such an efficient method of paying for the higher cost of the Service, since the deterrent effect would be absent. The choice is not easy; and it appears that until inflation is checked the finances of the Health Service, though under control, will still be precariously balanced from year to year.

THE NATIONAL FORMULARY AND "PRESCRIBERS' NOTES"

The 1952 edition of the *National Formulary* is now published, and, for the purposes of the National Health Service, will take the place of the 1949 *Formulary* from June 1. All doctors and pharmaceutical chemists participating in the Service will shortly be supplied with a copy. The Joint Formulary Committee, appointed by the medical and pharmaceutical professions under the chairmanship of Professor Wayne, has been responsible for the revision of the 1949 *Formulary* and has effected numerous improvements.

Freedom to prescribe what a doctor considers best for his patient has always been a jealously guarded prerogative of the medical profession, and many doctors have regarded official formularies with some suspicion as tending towards regimentation, and even direction, in prescribing. The issue of the *Formulary*, of course, in no way limits the prescriber to the preparations contained therein or to the form in which they are prescribed. There can be few occasions in practice, however, which demand the use of preparations not included in this work, even though it retains its pocket size, nor is it likely that the prescriptions of many doctors could compete with those in the *Formulary* in efficiency. Further, the general adoption of the preparations suggested would go far towards economizing on the national bill for drugs—a crucial necessity at the present time.

Twenty-seven pages are devoted to "Notes for Prescribers"; this was an acceptable feature of the 1949 *Formulary*, and it has been enlarged in the present one to include a number of new monographs. These compress a remarkable amount of essential information on therapeutics into a very small space. The practical, yet critical and scientific, approach to the problems discussed in these notes contrasts a little strangely with some of the preparations which appear later in the general section of the *Formulary*. For example, the scepticism shown in the "Notes for Prescribers" about the value of stimulant expectorants makes it surprising to find so many expectorant preparations among the mixtures listed. It would be inconceivable, however, for any formulary to satisfy completely all its medical users. There will be those who will consider that the committee has not been sufficiently drastic in deleting from the *Formulary* certain drugs believed to have had their day and been found wanting—such as bromides, potassium chlorate, colocynth, and jalap—while others will nostalgically regret the disappearance of grey powder, A.B.C. liniment, and creosote. On the whole the committee must be congratulated on having steered a safe course between the Scylla of scientific nihilism on the one hand and the Charybdis of reactionary empiricism on the other.

The compilers of the *Formulary* have given much thought to making the mixtures for infants more palatable. There are difficulties in getting a wide range of fruit flavours for mixtures and linctuses, because no standards exist for most of the commercial fruit flavours, but good use has been made of syrup of raspberry, and, to a less extent, of syrup of blackcurrant, for which standards are available.

Another important innovation is the introduction of English headings for the subsections of the *Formulary*, which leads to a more rational grouping—for example, eye drops, eye lotions, and eye ointments now occur together, whereas guttae, collyria, and oculenta were widely separated in the first edition. Coming events cast their shadows before, and the day may not now be far distant when the dog Latin of prescribing may be dropped altogether. However much we might regret such a change

on sentimental grounds, it must be realized that Latin is no longer the common language of scholars—far less of doctors—and that its continued use in prescribing has far more disadvantages than advantages. No benefit is gained by adding the suffix "um" to the name of new drugs, and the difficulty of giving them Latin titles is well illustrated by *Injectio Procainae Benzylpenicillini Confirmata*. Indeed, these difficulties have already proved insurmountable in the monographs devoted to "Preparations of Human Blood" in the *Addendum* to the *B.P.* in 1948. Apparently no member of the Pharmacopoeia Commission was sufficiently versed in the humanities to turn "Concentrated Human Red Blood Corpuscles" into Latin.

Another aid to prescribing has appeared this week. Under the title "Prescribers' Notes" the Ministry of Health and the Department of Health for Scotland are issuing to all N.H.S. doctors a loose-leaf folder giving information on the use and cost of drugs and dressings. The first number begins by pointing out that the estimated cost of the general pharmaceutical services in Britain in 1951–2 was over 20s. a head. The purpose of the notes is to offer examples of prescriptions "which might have been more economically done if information such as is included in these notes had been available to the doctor concerned." But there is no intention of interfering with the doctor's treatment of his cases. A week's treatment with chloramphenicol is shown to cost about £11, while treatment for about the same time with sulphonamides or penicillin costs about 10s. The indications for and against using chloramphenicol are listed.

The notes draw attention to the possibilities of using smaller packs of various dressings than are sometimes prescribed, and cellulose tissue is said to be cheaper than absorbent cotton-wool by 4s. 1½d. per lb. Figures at the end show that in 1950 18% of all prescriptions in the N.H.S. in England and Wales were for proprietary preparations, while in Scotland the proportion was 26%. The proportionate cost of ingredients in England and Wales was 44%, and in Scotland 47%. The notes are designed for filing in an ordinary record cabinet. They have been compiled with the guidance of nominees of the General Medical Services Committee.

CHEMOTHERAPY, ALLERGY, AND TUBERCULOSIS

The general question whether allergy to bacteria or their products is a reaction useful to immunity or merely an unfortunate side-effect of certain types of infection has divided immunologists for years. The subject has been critically reviewed by Hadfield and Garrod,¹ who consider that the weight of evidence favours the latter view. This is evidently the opinion of Long and

⁶ *Ibid.*, 1951, 2, 522.

his colleagues at the National Institute for Medical Research, since their work, to which we have referred in these columns² and which has recently been recapitulated in a single paper,³ is based on the assumption that rheumatic fever is essentially due to a hypersensitivity reaction to streptococcal allergens, analogous to tuberculin hypersensitivity. In an attempt to elucidate the pathology of rheumatic fever, they studied the sensitivity of guinea-pig skin to tuberculin and the effect upon it of mild ascorbic-acid deficiency, and of treatment with thyroxine, A.C.T.H., and cortisone. It is suggested, on the basis of such experiments, that the action of cortisone in the tissues of guinea-pigs sensitized by injections of B.C.G. is to facilitate the oxidation of ascorbic acid to dehydroascorbic acid, a process associated with a diminution in sensitivity to tuberculin, linked with sulphhydryl metabolism, and requiring thyroxine.

The theoretical justification for such an approach might be disputed and the analogy to rheumatic disease prove unacceptable, but the use of these methods to investigate the mode of action of antituberculous agents upon experimental tuberculosis in guinea-pigs needs no defence. Elsewhere in this issue, Drs. P. D'Arcy Hart, D. A. Long, and R. J. W. Rees show that the polyoxyethylene ethers (a group of detergents used commercially in the United States), previously shown to exercise an antituberculous effect in mice,⁴ exert a similar effect in guinea-pigs—an effect which in the latter species is invariably associated with diminished sensitivity to tuberculin. This desensitization is comparable in degree to that of cortisone, but differs from it in being independent of dietary and hormonal factors. Attempts to explain the antituberculous effect in terms of antibacterial action, increased phagocytosis, or exaggerated antibody response proved unsuccessful. The chief stumbling-block to attributing the antituberculous effect of these drugs to their desensitizing power is that cortisone, with its comparable desensitizing power, has proved pro-tuberculous, at least in mice.⁵ It is suggested that cortisone may differ from the detergents by depressing the mesenchymal cellular immune response to tuberculosis, and that this outweighs the benefits of desensitization; such an interpretation is in keeping with the facts, but must remain hypothetical until further studies elucidate the problem.

Fortunately other desensitizing agents are at hand. Fisher, Harington, and Long,⁶ have recently shown that the action of N-acetylspingosine in causing a diminution in sensitivity to tuberculin resembles that of these detergents. Dehydroascorbic acid and alloxan also possess comparable desensitizing power.³ Hart and his colleagues intend to test these compounds for antituberculous activity, which, if proved, would strengthen the hypothesis of a causal connexion between desensitization and chemotherapeutic activity. Whatever the outcome of these experiments, the introduction of this group of antituberculous and desensitizing agents has provided a new approach to an important subject, and with it the idea of a chemotherapeutic agent exerting its effect, not upon the tubercle bacillus, but upon the host.

FELLOWS OF THE ROYAL SOCIETY.

Three medical men and one medical woman were among the new Fellows of the Royal Society elected on March 20—Professor Bernhard Katz, Professor J. S. Mitchell, Dr. R. R. Race, and Dr. Marthe Louise Vogt.

Professor Katz is distinguished for his contributions to neurophysiology, and particularly for his work on nervous impulses and muscle end-plate potentials. He is at present professor of biophysics at University College, London. He graduated in medicine at the University of Leipzig in 1934. After holding a Beit Memorial Research Fellowship at University College he went as a Carnegie Research Fellow to Sydney, where he was also honorary lecturer in physiology at the University. He returned to University College, London, in 1946 as an honorary research associate and Henry Head Research Fellow of the Royal Society. Professor Mitchell has been professor of radiotherapeutics in the University of Cambridge since 1946, when this chair was established. He is also director of the radiotherapeutic centre at Addenbrooke's Hospital. Graduating in medicine in 1934, he was elected a Fellow of St. John's College two years later. Professor Mitchell's contributions to knowledge about the mechanism of the therapeutic action of radiations have been of outstanding importance. He was appointed C.B.E. last June. Dr. R. R. Race is the director of the Medical Research Council's Blood Group Research Unit at the Lister Institute. Qualifying in medicine in 1933, he was at one time assistant serologist at the Galton Laboratory, University College. His work on the rhesus and other factors capable of causing haemolytic disease has helped to complete one of the most remarkable of recent medical advances. Dr. Marthe Vogt has been lecturer in pharmacology in the University of Edinburgh since 1947. She graduated in medicine at the University of Berlin in 1928, and is well known for her work on the regulation of the secretion of the cortical hormones of the suprarenal gland.

Some of the other newly elected Fellows of the Royal Society have made important contributions to medical science. Dr. Honor Fell, who is Foulerton Research Fellow of the Royal Society and director of the Strangeways Research Laboratory, Cambridge, has greatly advanced the study of living tissues, particularly the mechanisms governing cartilage and bone formation. She is one of the editors of *Experimental Cell Research*. Dr. Rudolf Lemberg is director of the biochemical department of the Institute of Medical Research, Royal North Shore Hospital, Sydney. He has published many papers on the subject of metabolism of pigments derived from haemoglobin. Dr. D. D. Woods, reader in microbiology at Oxford University, played a major part in working out the explanation of the antibacterial action of the sulphonamides and has made many important contributions to bacterial chemistry.

We announce with regret the death on March 21, at the age of 79, of Professor Edwin Bramwell, formerly professor of clinical medicine in the University of Edinburgh.

REFRESHER COURSE FOR GENERAL PRACTITIONERS

EMPYEMA

BY

T. HOLMES SELLORS, D.M., M.Ch., F.R.C.S.

Thoracic Surgeon, Middlesex Hospital

Many pneumonias are cured by antibiotics; the more pneumonias cured, the fewer the empyemas. This accounts for the considerable reduction in the frequency of pleural infection at the present time as compared with, say, eight or ten years ago. Nevertheless, the distressing picture of an established chronic empyema, with toxæmia, loss of lung function, and a deformed chest, should always be kept in mind as a warning of what may happen if the early stages are not recognized, or are improperly treated.

Pathology

Infection of the pleural cavity is commonly secondary to inflammation of the underlying lung. There are other causes, such as penetrating wounds, which must include the incautious use of the aspiration needle in search of a subphrenic abscess, but for practical purposes the lung can be regarded as the primary focus. Tuberculous empyema should be regarded as a separate problem.

The earliest stage of pleural inflammation is the formation of an exudate, usually clear and containing bacteria, but rapidly becoming turbid as the cellular content of the fluid increases. This stage is conveniently referred to as "diffuse suppurative pleurisy," since, in the absence of pleural adhesions, the whole cavity is potentially infected. The characteristic shape of the effusion is the result of gravity opposed by the subatmospheric pressure of the pleural cavity; the usual basal position can be altered by changing the patient's position. The lung is collapsed and pushed aside as the fluid collects, and if a large volume accumulates the mediastinum will be displaced. The amount of fibrin in the effusion varies with different organisms; it is small with streptococcal infections, which are slow to localize, and is much more massive in the presence of the pneumococcus. Within a few days of onset the fluid is frankly purulent and fibrin is being deposited on the chest wall and over the lung surface; flakes, and even masses, of fibrin float loose in the effusion. At this stage lung and chest wall become adherent at the margins of the fluid and a "localized pleural abscess" can be said to be forming. An abscess with appreciable walls develops in 10 to 14 days, and if not treated the fibrin walls become firmly organized and rigid, progressively binding down the lung and preventing the chest wall from moving. This fibrin capsule is three or four times as thick over the chest wall as over the lung surface.

Diagnosis

The early signs of fluid over a consolidated lung are not always easy to make out. Dullness is more marked and breath sounds are more distant or absent with aegophony towards the thin margins of the fluid, but it is often difficult to be certain that a thin layer of fluid is or is not present when the signs in the lung are still well marked. This applies particularly to children. Later, increasing loss of movement and absence of air entry make the diagnosis more certain, and radiology can give considerable help so long as the film taken is a good one. Too often the use of indifferent or portable apparatus fails to give the necessary help. There is only one certain method of diagnosis: that is, aspiration of infected fluid.

The diagnosis should be easily established when there is enough fluid to produce pressure on the mediastinum. In

such cases marked shortness of breath and even cyanosis are added to the clinical signs, which include shifting of the apex beat and angulation of the trachea from the midline in the suprasternal notch.

Principles of Treatment

The principles that underlie treatment are twofold: (1) the toxæmic element must be eliminated and the products of inflammation moved from the pleural cavity, and (2) the lung must be re-expanded at the earliest possible moment, before it has become pinned down by fibrous tissue. This second factor is too often lost sight of because in other parts of the body drainage of an abscess (in the pelvis, for example) is followed by spontaneous obliteration of the cavity as the soft walls come together. In the thorax, however, the rigid chest wall and the collapse of the lung produce a firm-walled space which, if not treated correctly, may persist.

Treatment starts from the moment the diagnosis is made certain. Aspiration not only proves the presence of fluid or pus, but enables bacteriological examination to be carried out. In the early stages, as has been indicated, during the process of diffuse suppuration the fluid may be thin and almost clear even though loaded with organisms, but more commonly by the time aspiration is initiated frank pus will have formed. When the nature of the fluid and its bacteriological character have been established, energetic measures should be undertaken without delay to empty the pleural cavity.

Aspiration

Drainage and aspiration should not be looked upon as separate procedures. Aspiration is the equivalent of intermittent drainage, and if it is carried out properly it is of inestimable value, since it removes pleural fluid by a closed system—that is, one which does not admit air from outside. Unfortunately it is often used perfunctorily and inadequately, with unfortunate results on the course of the empyema.

Thorough aspiration may take a considerable time and must be performed with a needle of adequate size fitted with a two-way tap to a large syringe. The habit of using an ordinary 10-ml. syringe with an ordinary needle is fraught with potential danger because disconnection from the syringe may allow air to seep into the space, and if the empyema is not firmly localized the bubble of air will rise to the top of the chest and allow the lung to fall away from the apex. In other words, a collection of a small amount of fluid in the base of the chest may be turned into a pyopneumothorax with a fluid level and a collapsed lung. A localized empyema is converted into a total pleural infection.

Martin's syringe and needles make a convenient form of apparatus, consisting of a 20-ml. Luer syringe fitted to a two-way tap and with lock fittings to prevent accidental disconnection. A selection of needles is required, and though a wide-bore needle may be needed if the pus is thick a fairly fine needle can be used for a start. The whole apparatus should be tested for patency and for absence of leak before the operation.

The patient sits up in bed and leans over a pile of pillows or a bed table; he may be even more comfortable sitting sideways with the legs over the edge of the bed. A preliminary sedative is an advantage in most cases. The skin is cleaned over the site, which has been previously determined by percussion and radiology, and is usually about four fingerbreadths from the midline posteriorly in the

eighth or ninth space (if the twelfth rib is difficult to palpate it is useful to remember that the scapula lies over the seventh space). A wheal of local analgesic is produced in the skin, and 5-7 ml. of the analgesic is injected into the chest-wall tissues, particularly into the immediately subpleural layer. If a wide needle is being used a tiny incision through skin only, made with a tenotomy knife, makes the introduction of the needle easier. Some fluid—for example, local analgesic—should always be present in the aspirating syringe to prevent bursting of the barrel if the piston flies back suddenly on being released.

Aspiration must be as complete as possible, and the operation may take 20 to 30 minutes. If fluid is removed too quickly the patient will feel uncomfortable and develop bouts of coughing, but if the procedure is carried out slowly and, above all, with the needle rigidly still the contents will be evacuated and the lung at the same time encouraged to re-expand. If bacteriology is indefinite, as may well be the case if antibiotics have been used, aspiration must still be performed in just as complete a manner. If, on the other hand, there are active organisms in the fluid an injection of the appropriate antibiotic should follow. Penicillin is the usual agent, and 500,000 units in 10 ml. of saline can be introduced at the end of the aspiration.

The next important step is to ensure that further complete aspirations are carried out as often as any fluid collects; and this does not mean that one should wait three to four days, or even longer, to see what is going to happen. If treatment is to be effective the pleural cavity must be emptied, if necessary, on consecutive days, and aspiration should be abandoned only if the fluid becomes too thick to flow through the needle or, as more commonly happens, flakes of fibrin obstruct the flow. This is probably the most important point in treatment, and one which is often found at the first aspiration. When this occurs it can safely be assumed that the pus is localized, and indeed the thickening of the pleura may be easily obvious on x-ray examination or felt during the passage of the aspirating needle.

Surgical Drainage

When aspiration has become impracticable the decision on the next move depends on the bacteriological findings. If there are still active organisms the abscess should be drained by rib resection at the lowest possible point, accompanied by thorough toilet of the inside of the cavity and wide-tube drainage.

The operation can be carried out under local or general anaesthesia. The patient should be in the sitting position in order to avoid the formidable risk of pus pouring into the lung through an unsuspected broncho-pleural fistula. The lowest point of the cavity is determined by previous aspiration or, in cases of difficulty, after study of two-plane radiographs following injection of 10-15 ml. of radio-opaque oil into the cavity. A vertical skin incision is made. The usual site is the ninth rib, 2 to 4 in. (5 to 10 cm.) from the midline, closer to the spine than might be expected. The rib is stripped of periosteum before removing 2 to 3 in. (5 to 7.5 cm.) of its length, and complete haemostasis obtained before the pleura is opened. A piece of pleura is routinely taken for section to exclude tuberculosis, neoplasm, and so on, and, after the pus and fibrin masses have been removed, the interior of the empyema is inspected and freed from all loose tissue. A wide tube is then inserted: the tube must be placed so as to avoid intercostal vessels and nerves, with its interior opening inside the empyema but not so far as to impinge on lung. Its distal end should not project more than a few millimetres beyond the skin—merely enough, in other words, to hold a safety-pin which, in turn, is attached to the skin by pieces of adhesive plaster. The tube is covered with a simple dressing held in place by a "corset" of strapping, which avoids the discomfort of bulky dressings so common in the past.

The control of drainage tubes is the surgeon's problem, and not one to be left casually to students or nurses. When

a tube is used a number of common errors must be guarded against. In the first place the tube may not be large enough; if the tube is not placed at the bottom of the cavity, drainage will be incomplete. If the tube is changed frequently the contracting skin incision will sooner or later necessitate a smaller tube, and if this happens more than once or twice the drainage opening may become completely inadequate. Many cases of comparatively large chronic empyemas with pin-point sinuses intermittently discharging quantities of pus have been seen in the past. The time for removal of the drainage tube can be summarized by saying that the tube is *never removed from the pleural space but only from a track in the chest wall*. In other words, internal healing must be confirmed by pleurograms (two-plane radiographs taken after filling the space with radio-opaque oil) at 10- to 14-day intervals until the space is finally obliterated.

Breathing Exercises

Even with the most efficient treatment by drugs and surgery the result will be valueless unless at the same time the collapsed lung expands again. The lung must be induced to re-expand, not only to obliterate the empyema space, but to restore pulmonary function. Left to his own inclinations the patient will not move the affected part of the chest more than he can help; the instinct is to immobilize the area. But recovery is complete only when the chest walls are moving freely, and for practical purposes the movement of the chest wall is an index of lung expansion and function. A flattened rigid chest wall is almost certain to conceal an inactive area of lung.

The answer lies in the concentrated application of special breathing exercises which aim at producing a powerful and localized inspiratory excursion over the damaged area. Expiratory exercises, represented by puffing and blowing, should be ignored. The patient is instructed to breathe in deeply and forcibly against the light pressure of the physiotherapist's hand without arching or bowing the spine. After a few days he should be able to concentrate the effort in any part of the chest and he must then practise without fail for 10 to 15 minutes every waking hour, with a check once or twice a day by the physiotherapist. It is the conscientious patient who benefits and reduces his convalescence to a minimum.

The actual exercises are quite simple, but one must repeat that it is persistence and concentration that count. They are begun almost from the day of diagnosis and are continued with increasing intensity until complete recovery results, with the bad side of the chest moving even better than the normal side. The activities of the patient are encouraged by having him ambulant as soon as the grosser signs of toxæmia have been eliminated. The practice of keeping a patient in bed during the whole period of aspiration or drainage is detrimental to early recovery. During the final stages of closure of the empyema patients benefit by active exercise, and many of our patients are walking 8 to 10 miles (12.9 to 16 km.) a day as part of their convalescent treatment.

The Sterile Empyema

A difficult decision on treatment arises when a sterile empyema is encountered. The fluid has been sterilized by the action of penicillin, and the problem is that of a sterile abscess with thick fibrin walls. This poses the question of differentiating this form of empyema from one of tuberculous origin in which, in the absence of acid-fast organisms, a high proportion of lymphocytes in the pus may be the only clue, apart from the clinical history. A sterilized pyogenic abscess usually contains numerous broken-down polymorphonuclear leucocytes, and the shadowy forms of dead bacteria may be seen though bacteriological culture remains sterile. Indeed, a smear film often gives more satisfactory and certainly quicker information in all stages of pleural infection. The fibrin deposit in sterile cases is

even thicker than usual, because with the destruction of bacteria fibrinolytic enzymes are also destroyed. These enzymes are actually manufactured, under the names of "streptokinase" and "streptodornase," and can be introduced with the object of dissolving fibrin. There is a natural reluctance to drain a sterile cavity, with the result that many of these "penicillin empyemas" are left alone, and the thick walls of the persistent cavity prevent healing. Nearly all these cases can be attributed to faulty handling in the form of tardy diagnosis or inadequate aspiration.

In some cases breathing exercises and proper aspiration will start the closure of the cavity, but some do not respond because of the thickness of the contents, as well as the rigidity of the walls, and here two courses of action are open. The cavity can be opened and evacuated through a rib-resection incision, but drainage is not used; instead the skin only is sutured and breathing exercises are intensified. If this fails it is a simple matter to open the skin and insert a drainage tube. The second more radical and severe operation is that of decortication or pleurectomy, which in its best form entails complete excision of the empyema through a thoracotomy incision. The parietal pleura is removed from the chest wall and the lung is freed from its casing. Closed suction drainage and active physiotherapy encourage re-expansion of the lung and obliteration of the dead space. Pleurectomy should not be undertaken for at least six to eight weeks from the onset, and then only if other methods have failed. It can produce excellent results, but it is an operation of some severity and should not be performed if improvement is occurring under more simple measures. Where there is efficient physiotherapy it is not often indicated.

Prognosis

A properly treated empyema of moderate size and severity should be cured in 8 to 10 weeks at the outside. Beyond this period cavity healing is slow and the empyema is well on the way to becoming chronic. A chronic empyema is a formidable disability which may take months to cure, and a useful aphorism to remember is "a week's delay in the early stages means a month's longer convalescence."

Common Causes of Delayed Resolution

There are still many errors in treatment that could be remedied. In the first place diagnosis is not always made early enough, and thoracic surgeons commonly see cases of empyema which are at least a month or six weeks old and which have not been previously treated. Sometimes a collection of fluid that is awkwardly placed may be responsible for the failure to recognize the condition, but usually it is because the lung signs have dominated the picture and the question of pleural infection has been ignored. There may have been failure to start treatment even when the condition has been suspected. Diagnostic aspiration may be put off for a day or so and complete aspiration may be delayed for two or three days while awaiting bacteriological reports and so on. Even when aspiration has been carried out there is sometimes no attempt at any further aspiration, even though the fluid re-collects. Aspiration is often suspended because the pus is sterile. The formal aspiration itself may fail because of faulty apparatus or obstruction of the needle by fibrin flakes. Admission of air is a danger already mentioned. Frequently, once 200 to 300 ml. has been withdrawn, the patient or operator tires and the evacuation of fluid is incomplete. Again, there is too often marked delay between the aspirations and the failure to recognize that complete removal of the fluid will help the re-expansion of the lung. Too much dependence is placed on antibiotics, particularly if these have resolved the infection and signs of toxæmia in the patient. There is also a tendency to delay consultation with the surgeon until some days after aspiration has started to be difficult. There should be complete continuity in the treatment from the

original recognition of fluid until the space is completely and finally obliterated.

There are atypical forms of empyema which are admittedly difficult to diagnose and treat. The discussion has been concerned so far with a limited collection of pus at the bottom of the chest, but the infection can be total or localized to some unusual site. A total empyema requires the most energetic and early treatment if the lung is to re-expand readily, and suction drainage or continuous aspiration can be used with advantage before too much fibrin has been deposited. The lung expands more readily at the base, and may shut off an apical pocket which requires individual treatment. Interlobar collections are more usually placed anteriorly and can easily be missed if good lateral radiographs are omitted. The same applies to pockets placed well above the diaphragm. Mediastinal empyema, which is often mentioned in textbooks, is very rare.

The differentiation between basal empyema and subphrenic abscess, lung abscess, and infected cysts is difficult, particularly if the empyema is complicated by a broncho-pleural fistula. An empyema may heal spontaneously by rupturing through the chest wall or into a lung, but the dangers of the latter range from immediate drowning to chronic pulmonary infection. When empyema is secondary to carcinoma of lung it is possible that it may not heal, and the same applies if a tuberculous infection of the pleura is present. An actinomycotic empyema may heal, but will persist if the lung disease is progressive.

There are few examples in medicine in which early and prompt treatment can pay such dividends as in pleural infection. Antibiotics have reduced its incidence, but diagnosis and treatment have not kept pace, with the result that the spectre of chronic empyema still remains to be finally exorcized.

Next Refresher Course Article.—"The Psychiatric Case and the Law," by Professor Alexander Kennedy.

Nova et Vetera

PIONEERS OF ANAESTHESIA

The English Pioneers of Anaesthesia (Beddoes, Davy, and Hickman). By F. F. Cartwright. (Pp. 338; 20 figures. 21s.) Bristol: John Wright and Sons. 1952.

Dr. Cartwright has told us much of the lives of three men of extremely different mentality, character, and fate. There results a valuable and instructive picture of the conditions of experimental investigation in the late eighteenth and early nineteenth centuries in England, where laboratories hardly existed. In the whole of Britain it was only at Edinburgh and Glasgow that scientific university training was available. Of the three men with whom the book is concerned, only Davy is generally remembered. Beddoes is known to a few, though rather for his associations than for himself, while Hickman is recalled only by a handful of historical specialists. Here Fame must be adjudged to have distributed her favours justly.

From the earliest times attempts have been made to procure unconsciousness during operations by drugs, both ingested and inhaled. "God caused a deep sleep to fall upon Adam, and He took one of his ribs and closed up the flesh thereof" (Genesis ii. 21).

"I'll imitate the pities of old surgeons
To this lost limb, who, ere they show their art,
Cast one asleep, then cut the diseased part."

(Thomas Middleton, *Women Beware Women*, c. 1620.)

Between the dates when these two passages were written, and indeed both before and after, this idea has been in the

minds of thousands of surgeons. The *spongia somnifera* was a commonplace of surgery for ages. Therefore, for having attempted to produce anaesthesia neither Beddoes, nor Davy, nor Hickman deserves any credit at all, and it is only by the means that they adopted that they can be judged. Nevertheless these men were so diverse in temperament and scientific approach that their consideration within the covers of one book gives special interest to Dr. Cartwright's narrative. For truly the psychology of discovery is an absorbing theme; it is a pattern not only intricate in itself but susceptible of endless variation.

Thomas Beddoes (1760-1808) was a member of a trading and farming family in Shropshire. He was educated at Oxford, took an interest in languages, and translated some important scientific works into English. He turned early to chemistry and geology. After a time at Edinburgh he took his M.D. in 1786, visited Paris, and in 1787 became reader in chemistry at Oxford. By temper restless and by opinion radical, he had no easy position in that conservative centre. After trying London and Birmingham, he settled in Bristol, where he started practice and a laboratory. In 1793 he founded an institute for "Pneumatic Medicine." It was the age of the "new chemistry" of Black, Lavoisier, and Priestley. "Gases"—by your leave—were in the air and were a general subject of scientific conversation. Beddoes had a real genius for intellectual friendship and absorbed much on gases—interpreting some of it wrongly and some of it even fantastically. He was bursting with ideas but was weak in designing experiments, far from strong in performing them, and persistent in misinterpreting them. He had no clear notion either of controls or of limitation of variables—the two sheet anchors of those who would embark on the experimental way. He was convinced, against the evidence, of the beneficial effect of inhaling "factitious airs"—that is, of the simpler gases that were then the subject of much investigation. He achieved nothing scientifically important, and his wayward genius turned to other fields. His institute rightly came to an end, but not before his perceptiveness of human qualities had distinguished the genius of his brilliant assistant, Humphry Davy. Dr. Cartwright's treatment of the intricate personality of Beddoes is a real addition to our knowledge of the scientific scene of the time.

Of Davy less need be said here, for so much more is known. Undoubtedly he is responsible for the effective knowledge and action of nitrous oxide and so, at some remove, for its use in surgery. His own many experiments with it, including many on himself, resulted in the phenomena which gave it the name of "laughing gas." He was not a doctor nor was he particularly physiologically minded, but he was, nevertheless, the effective founding father of modern anaesthesia.

Henry Hill Hickman (1800-30) is a peculiar and pathetic figure. He died untimely. It is impossible to say what a young man of 30, of an experimental disposition, might have done. Such young men are rare. What he did, in sober fact, was to show how *not* to anaesthetize. In a series of experiments on animals he used carbon dioxide as an inhalant. Unconsciousness ensued. It was then possible to remove a part without sign of pain. It was also possible, under experimental conditions, to revive the creature afterward, a fact long known from demonstrations to tourists at the "dog's grotto" near Naples. This scene had formed a high spot in the Grand Tour as organized for young sprigs of the nobility and gentry since the sixteenth century. Hickman showed persistence, experimental talent, enthusiasm, good faith, and good will. It is easy to see now that he was on the wrong line. Who shall say whether, given time, he would have had the flexibility and open-mindedness to shift to a more hopeful approach? It might have been. It might have been. A sad story well told. But it may not be generally known—it was not to the reviewer—that the late C. J. S. Thompson, of the Wellcome Historical Medical Museum, was a grandson of this unfortunate young man.

CHARLES SINGER.

Preparations and Appliances*

AN AID TO ANALGESIA OF THE LARYNX AND TRACHEA

Dr. T. DINSDALE, anaesthetist, Manchester Royal Infirmary, writes: In 1949 I described a technique of topical analgesia for bronchoscopy. This involves three steps—namely, spraying the mouth and pharynx; swabbing the pyriform fossae; and injecting 2 ml. of analgesic solution through the cords, using a laryngoscope and a syringe with a cranked nozzle.

There have been many reports (Thomas and Fenton, 1943; Titche, 1947; Richards, 1947; Jackson, 1949; Weisel and Tella, 1951) of toxic reactions following the use of 2% amethocaine solution, but our experience with a 1% solution is that it is both effective and safe when used carefully. Nevertheless, when using such crude nebulization as is pro-

vided by the average throat spray and injecting a further 2 ml. of liquid directly into the trachea, it is easy to appreciate that a considerable quantity of amethocaine may be absorbed. I discussed this aspect of local analgesia with Mr. James Juby, of Messrs. A. C. King Ltd., and he has designed a spray which overcomes most of the difficulties. It consists of a one-piece bulb and base with a concentric anaesthetic container holding 3 ml. This can be operated with one hand. To it is attached any of the standard nebulizers—for example, Magill's, Rowbotham's, etc. In addition there is a straight nebulizer, with the same angle as Magill's endotracheal-tube-holding forceps, for spraying the glottis when using an orthodox laryngoscope (see illustration). It is long enough to be applied through the cords to the upper end of the trachea. The tip should not be curved for use with a Macintosh laryngoscope, as this latter advantage is then lost. The fine spray provided by these nebulizers allows a much smaller total quantity of solution to be used: 3 ml. of 1% amethocaine is quite enough, if the pyriform fossae are swabbed, to provide perfect analgesia down to the carina in the adult.

I must thank Mr. Juby for the excellence of his design and the high standard of workmanship. The spray, to be known as the "multicaïne spray," is obtainable from Messrs. A. C. King Ltd., 27, Devonshire Street, London, W.1, and can be supplied with the nebulizer described above or with any other standard pattern.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

Family Planning

SIR,—The Family Planning Committee of the Medical Women's Federation is to be congratulated on its memorandum (March 15, p. 595). The recommendations are both timely and courageous, especially the final one "that advice on family planning should be available to women who require it on medical grounds, and also to women who ask for it for the purpose of family spacing. . . ."

No one would disagree with the suggested groups in the profession who should give this advice. But I would add that every maternity hospital or department should have a contraceptive clinic attached to it; if medical students are in obstetric training there they should be allowed to attend this clinic. The time when contraceptive advice should be given is at the first visit to the post-natal clinic, usually at the sixth week after delivery. Many recently delivered mothers begin to worry before they leave the lying-in wards about future marital relationship and pregnancy.

It should be an obligation on the part of those—doctor or midwife—who have been responsible for the care of a woman during her delivery to see that she is given facilities for receiving contraceptive advice if she wishes this.—I am, etc.,

London, W.C.1.

W. C. W. NIXON.

SIR,—The interesting and thoughtful report on family planning produced by the Medical Women's Federation (March 15, p. 595) inevitably leaves many difficult questions still unsolved. In the first place it seems desirable to clarify the position of the Catholic practitioner. If he or she is holding a public appointment, the old-established ruling of the Ministry of Health that no one should be required to give advice on birth control contrary to his religious belief still holds good and presumably is applicable to all medical practitioners under the National Health Service. I take it that if a non-Catholic patient of a Catholic doctor required birth-control advice on medical grounds and is not satisfied to accept such methods as the Catholic doctor feels able to recommend (i.e., safe period and abstinence), she should be instructed to apply at the Town Hall, where she will be directed to a clinic or to a general practitioner willing to meet her needs. This could easily be organized.

The problem of the woman who desires contraceptive advice "for the purpose of spacing her family" raises much broader issues. If the very sensible recommendation of the report of the Medical Women's Federation is accepted and a fee is collected for this service, the patient can of course go to any doctor or clinic she prefers without causing administrative confusion. But there are aspects of this matter which affect all of us without distinction of religion. It would have been helpful if the report (which shows a sensitive social outlook) had included a word of warning about the dangers inherent in a general policy of "spacing." We all know that such demands vary from the tragic to the merely frivolous. It would be only too easy in organizing a comprehensive service to create a "climate of opinion" in which the postponement of childbirth to a convenient period became the expected thing, and as life becomes progressively harder the convenient time for the second or even the first child might never come. Parenthood without prolonged sacrifice is a dangerous myth which enthusiasts for family planning may unwittingly foster. It is surely worth discussing whether the medical profession is to drift into a position of handing out contraceptive advice on demand

or to maintain that it has some responsibility for seeing that the patient (and the nation) is not being encouraged in a disastrous policy.—I am, etc.,

London, S.W.3.

LETITIA FAIRFIELD.

Soviet Genetics

SIR,—One would not venture to accuse a reviewer of prejudice did he not confess to it himself. Professor S. C. Harland (March 1, p. 472), in reviewing *Soviet Genetics*, by Morton, ends by saying: "All books by Russians or about Russians are exasperating, and this one is no exception to the rule. Russian genetics may be described as a mixture of the blatantly fraudulent, the naive, the nationalistic, the obvious, and perhaps, in rare cases, the interesting and novel." It seems from the context of the review that the Russian cotton geneticists have achieved results somewhat different from those obtained by Professor Harland, a not unusual circumstance in the history of scientific research. But the book contains a great deal of information far more important than this, and surely it might have had some mention in the review, "exasperating" though it probably is to the reviewer.—I am, etc.,

London, W.C.2.

F. WOOD JONES.

SIR,—Perhaps I can make my position a little clearer to Professor F. Wood Jones. First, the work now being put out in Russia violates all the agreed rules for the writing of scientific papers. The methodology is not described in such a way that the experiments can be repeated and the results verified. Conclusions are consequently drawn from the data which the reader is not able to draw for himself. In rare cases when it has been possible to repeat Russian experiments the results have never been confirmed. Perhaps a few of the latest claims made by the Russians may be cited as causes of exasperation. In a recent paper Lysenko says that in 1949 200 rye grains were found in ears of wheat. These gave mostly rye plants. Mention is made of barley plants obtained from seed of the branching wheat. Finally, to work on biology in the Soviet Union you have to believe in the inheritance of acquired characters because the Party has made this doctrine official, and you have to agree with the designation of Mendel as a "reactionary cleric."

My prejudice is merely against shoddy work and slipshod hypotheses.—I am, etc.,

Manchester, 13.

S. C. HARLAND.

Carcinoma of the Stomach

SIR,—I have read with interest Dr. C. P. Petch's letter (March 1, p. 492) on diagnosis of carcinoma of the stomach and his statement that he has seen seven patients dying of gastric carcinoma in the last four years, and that in each case early diagnosis had been missed by barium meal. Final diagnosis rested on laparotomy or necropsy, and he asks for more reliable means of confirming clinical suspicions.

May I suggest that clinical evidence is often not obtained with sufficient care, as I know from experience? I always take the patient's history myself, especially when dealing with hospital patients. Even if careful radiology fails there is often a reliable means—namely, gastroscopy—and laparotomy is definitely justified if clinical symptoms are strongly suggestive, and in the hands of a good physician and surgeon I would gladly avail myself of this if the occasion arose; and surely gastric secretion investigation is not obsolete.—I am, etc.,

London, W.1.

G. E. VILVANDRE.

Addison's Disease and Pregnancy

SIR,—I was very interested in the medical memorandum on this subject by Dr. T. A. Richards (February 23, p. 421). I had a case recently of a woman aged 25 who had been treated for Addison's disease for seven years. I will not

enter into details of the case, except to say that throughout the later part of the antenatal period the woman stated she was better than she had been for years. Her maintenance dose of "eucortone" was 5 ml. daily intramuscularly. She had had a D.C.A. implant of 300 mg. in January, 1951. The baby weighed 7 lb. 12 oz. (3.5 kg.) at birth, was alive, and appeared normal in every way. Although the woman gave a history that she had had a crisis in 1947 when she had been in coma for four days, also a crisis in March, 1950 (coma for three days), she went through the pregnancy, labour, and puerperium without any crisis. I was grateful to Dr. G. E. F. Sutton for the supervision of her medical care.

Dr. Richards omitted to record the most recent review of 39 cases by Dr. Florence Brent, of Brooklyn (*Amer. J. Surg.*, 1950, 79, 645). Of her 22 full-term pregnancies 12 patients developed crises after delivery and seven patients died. She believes that patients with Addison's disease are very susceptible to barbiturates and morphine, and sedation throughout labour should be kept at a minimum. An interesting point she recorded was that none of the patients in the series had developed toxæmia of pregnancy. Spontaneous delivery at term was followed by the best results.

The association of pregnancy with Addison's disease is possibly becoming more common with greater improvement in the medical care of the Addison's disease. But as long ago as 1922 Dr. Gilbert Fitzpatrick, of Chicago (*Surg. Gynec. Obstet.*, 1922, 35, 72), reported a case and reviewed the reports of 11 such cases already published. It was he who stated that lactation should be forbidden, "as it renders the patient weaker." Dr. S. L. Simpson (*Proc. roy. Soc. Med.*, 1946, 39, 511) recorded two successful pregnancies in a case of Addison's disease.—I am, etc.,

Bristol.

G. GORDON LENNON.

Goat's Milk and Infantile Eczema

SIR,—I feel that it is worth drawing the attention of your readers to some recent experiments in the treatment of infantile eczema. This condition, which first appears when the child is being fed primarily on cow's milk, has been considered to be due to an allergic reaction, and some cases have responded to a diet which contains no cow's milk. A diet of this type is, however, difficult to arrange and may result in other undesirable symptoms.

Two years ago it was decided to substitute goat's milk for cow's milk in the diet of two babies undergoing treatment for infantile eczema at a Midland hospital. Within three days the inflammation round the eczema patches had subsided, and in 33 days all signs of eczema had disappeared. The treatment was extended to five more babies with equally good results. Attempts to return to a diet of cow's milk, pasteurized or unpasteurized, and to patent baby foods, all resulted in fresh outbreaks of eczema within 48 hours. The treatment is now being extended to older children and adults, and the results are promising, but not yet conclusive, in these long-standing cases.

If eczema is an allergic condition it is probable that the protein fraction of goat's milk is an important factor in the cure; but it is also important to remember that the fat in goat's milk is in a much more finely divided condition than in cow's milk and so can be more easily assimilated.—I am, etc.,

Salcombe.

PHYLLIS G. CROFT.

Pink Disease and Infections

SIR,—Dr. W. J. M. McLeod (March 15, p. 605) makes appropriate comment on two cases of pink disease, reported by Dr. A. S. Cook (February 16, p. 383), which appeared to respond satisfactorily to antibiotic (chloramphenicol) therapy. Dr. McLeod's case of pink disease developed pertussis, and after three weeks all symptoms of pink disease had disappeared; and this was before the advent of antibiotics. He was able to refer to a case of pink disease cured by measles.

Because of his express interest in a possible relationship between pink disease and the common infections of infancy may I refer him to a recent paper on mercury and pink disease (*Lancet*, March 1, 1952, p. 441) by Dr. A. Holzel and myself? We mention a fact that "five children with severe pink disease showed simultaneous recovery from an intercurrent infection and the acrodynia. The intervening illnesses were measles in three cases; chicken-pox, and tonsillitis."—I am, etc.,

Manchester, 19.

THEODORE JAMES.

What Doctors Prescribe

SIR,—On reading the article by Professor D. M. Dunlop and others (February 9, p. 292) I was assailed by a strong sense of guilt. I felt that something had to be done about it, so, picking up the textbook of medical treatment of which he is joint editor, I opened it at the preface.

I noted with satisfaction that in this book "the number of drugs advised are considerably fewer than in some books of therapeutics." Thus encouraged, I turned to the section on respiratory diseases, as I was rather uneasy about a couple of proprietary expectorants I am in the habit of prescribing for some of my many chronic bronchitics. I was taken aback to discover that I had neglected to give gargles, sprays, vitamins, and iron for prevention. I am certain that I have neglected to ensure an adequate protein intake in some of my cases and had almost completely ignored mixed anti-catarthal stock vaccines. My crime in ordering an effective proprietary seemed less heinous when I discovered that had I followed the book I should have had to employ an expectorant combined possibly with an antispasmodic, and "sedative drugs separately." Nor was I to forget inhalations of medicated steam, digitalis in certain cases, and the control of obesity in others—by diet alone, no doubt, to save on the dextro-amphetamine—still keeping up the patient's resistance without recourse to any more vitamins, I suppose.

Still, I have no doubt that in practice Professor Dunlop and his learned colleagues know just how to combine all the excellent advice one finds in the best textbooks, cheaply and efficiently. One only hopes that in the future as in the past some of the experts will actually join the ranks of general practitioners and see the work at first hand. Misunderstandings arise when people seek to understand our job by browsing over prescriptions.—I am, etc.,

Scarborough.

DAVID MCGILL.

SIR,—Psyche, soma, and surroundings mix, and the result is old Mrs. Brown, and only her G.P. knows what works with her. The expert, with usually only one ingredient to experiment on, gets a different result. Both are right: the expert writes an article explaining the errors of the G.P., and so it has always been. The trouble now is that the State leaps to believe the one receiving the salary of an expert and comes blundering in on the more complex triad—poor old Mrs. Brown.

A lecturer of old said to my Year, "It is quite ridiculous to give a cough mixture containing an expectorant and a sedative. But, gentlemen, it works!" And that is our operative word.—I am, etc.,

Cromer.

A. H. GREGSON.

Medical Treatment of Hypertension

SIR,—In your leading article (March 15, p. 587) appears the statement: "There is now little doubt that surgical treatment has materially lowered the fatality rate of hypertension." It is to be regretted that a section of your journal which usually carries the weight of authority should include so dogmatic a statement. There are many who consider surgery a justifiable procedure for the relief of symptoms, but there is certainly more than a little doubt that it has materially lowered the rate of mortality.—I am, etc.,

Horley, Surrey.

T. W. PRESTON.

Chicken-pox Repeated

SIR,—As second attacks of chicken-pox are of rare occurrence I thought that the following account of two cases in the same family would be of interest and worth reporting.

On November 12, 1951, I was called to see a boy aged 5 years, one of monovular twins. He had a pyrexia of 100° F. (37.8° C.), and had a well-developed papulo-vesicular eruption having the typical distribution of chicken-pox and which had first appeared the evening before I saw him. He had lesions in the scalp and on the soft palate, and I had no hesitation in diagnosing the condition as that of chicken-pox, as he had not long commenced to attend school and there was an epidemic of chicken-pox in the district at the time.

A few days later his twin brother developed a similar eruption with a moderate pyrexia and was obviously another case of chicken-pox.

Both boys had the normal course of the disease and were clear of the eruption and quite recovered in three weeks from the commencement of the disease in the second boy.

On December 28 I was again called to the house to see the first twin, who had broken out in another papulo-vesicular eruption that same morning. This time he had no fever, and at first I was inclined to think that he had a lichen urticatus, on account of the severity of second attacks of the chicken-pox and also because of the very recent attack which he had had.

However, the rash was again so characteristic, both in the individual lesions and in their distribution, that I was forced to accept this as another attack of chicken-pox, and when, three days later, his twin brother also broke out again in a typical eruption there was no possible doubt about it.

Both boys continued with the eruption for about ten days and were clear in a little under three weeks on this occasion.

The most remarkable feature about these two cases is the extraordinarily short interval between the two attacks, and apparently the boys became reinfected almost as soon as they returned to school after their first attack.—I am, etc.,

Birmingham.

C. SPENCER WHITEHOUSE.

Proctalgia Fugax

SIR,—In notes and correspondence on the subject of proctalgia fugax (see "Any Questions?" March 22, p. 669) I have not (so far as I remember) seen it suggested that a predisposing factor for the occurrence of the painful cramps in question may in certain individuals be an unnatural condition of emptiness in the lower bowel brought about by ordinary purgatives or otherwise. I remember, though I cannot lay my hands on it, an elaborate paper published in France some years ago in which the writer stated that in certain patients by frequent x-ray examinations he had found that spontaneous cramp-like contractions were more likely to occur when the bowel was empty. This might help to explain occasional attacks of proctalgia fugax in relatively young persons as well as more frequent attacks in older individuals in whom other conditions such as senile constipation or abdominal atheroma are more likely to be present.—I am, etc.,

London N.W.1.

F. PARKES WEBER.

Experiment in Peacemaking

SIR,—Dr. R. L. Kitching (March 8, p. 548) is asking the B.M.A. to act in a very high-minded and desirable manner. The Association consists of members who, like other members of our community, are very concerned with the prevailing social insecurity. This insecurity, expresses itself as a driving concern to increase the size of one's income, which is reflected in B.M.A. thought and policy. In times past the Association was able to devote much of its time to higher things which were in keeping with the dignity of a humanitarian profession. The language used was on an equally high plane. This language is still used, but as a guise for less dignified proceedings, such as the distribution of secret awards. It is hardly likely that the state of mind in which this was done is also capable of contemplating an idea such as that which Dr. Kitching suggests, let alone the decline in social organization which makes such an idea imperative.

The financial and technical supremacy of the present Western civilization is rapidly drawing to a close. Within that supremacy were many fine ideas which alone can prevent our complete eclipse. Ideas are man's most precious attribute, and they will flourish wherever there is human life; bombs destroy both ideas and life. It is the duty of everyone to try to see through the present social fog and to cultivate the ideas which alone ensure survival. Military strength is, regrettably, an important factor in national policy, but by itself it is universally lethal. It must be controlled by sound ideas and ideals.

I very much doubt if the B.M.A. will be able to help in this matter.—I am, etc.,

Liverpool.

H. E. VICKERS.

Wooden Heel for Walking Plasters

SIR,—I have found this wooden heel for walking plasters superior to the conventional Böhler iron and think it may be of general interest. It is fashioned from a piece of wood $3\frac{1}{2}$ in. (8.8 cm.) by $\frac{1}{2}$ in. (1.25 cm.) by $1\frac{1}{2}$ in. (3.8 cm.) and is given a concave upper surface so that it fits closely to the underside of the plaster. It is placed in line with the anterior border of the tibia and held in place by turns of a 4-in. (10-cm.) plaster bandage.

With this heel one obviates the pivoting so common with the Böhler iron, and by being raised above the ground the base of the plaster is protected and does not tend to crack as it may when a sandal is worn. This device does not obscure a lateral x-ray of the tibia and fibula, and as the foot is raised only 2 in. (5 cm.) from the ground it is unnecessary to raise the heel of the other shoe. A further advantage is that it is economical.—I am, etc.,

Birmingham, 16.

DONALD POTTINGER.

**Ryle's Tube in Trachea**

SIR,—Mr. Eric Coldrey's reference to a stomach tube in the trachea (February 16, p. 382) is interesting, but I suggest the implications are more important than is at first apparent. In Mr. Coldrey's case no ill result ensued, but it is easy to imagine a more unfavourable outcome had the tube remained undiscovered, as the following case illustrates.

Following drainage of an advanced peritonitis due to a gastric perforation, a middle-aged man was receiving intermittent suction. A radiograph to check for subphrenic abscess showed the Ryle's tube in place. Twenty-four hours later several successive aspirations were negative, but the patient soon proved the inadequacy of the suction and vomited. Afterwards he appeared no worse and was alert, complaining of no discomfort, with the nasal tube apparently still in place. During the following hour aspiration was negative and the patient became mildly dyspnoeic and cyanosed. Oxygen was given and a house-surgeon informed. On the latter's arrival he found a very apprehensive, blue, collapsed patient, complaining of intense pain in the chest and throat. Pulmonary embolism was diagnosed, but when a radiograph showed the end of the Ryle's tube in the right lower bronchus a shocked ward sister associated the patient's collapse with her attempted resuscitation before the resident's arrival: a quantity of diluted brandy had been injected into the bronchus, not, as was thought, into the stomach. The patient's failing constitution did not survive this additional setback.

In this case, no doubt general debility led to the partial suppression of the laryngeal reflexes, but this can also occur following simple catarrh, over-use of the voice, and less obvious general weaknesses such as anaemia. Patients vary in their ability to control their involuntary reflexes, and they can be exhausted by repeated or prolonged stimulation. I

FOR THE RELIEF of bronchial asthma, a choice of 'Neo-Epinine' preparations is available. Almost immediate relief is obtainable by oral inhalation of No. 1 Spray Solution, a plain 1 per cent aqueous preparation. The 20 mgm. compressed products, placed beneath the tongue, act within 5-10 minutes. Stubborn cases need oral inhalation of No. 2 Compound Spray Solution which contains 1 per cent of drug with 2 per cent of papaverine and 0.2 per cent of atropine methonitrate.

'Neo-Epinine'
ISOPRENALINE SULPHATE
IN THE TREATMENT OF ASTHMA

BURROUGHS WELLCOME & CO. (THE WELLCOME FOUNDATION LTD.) LONDON

'PERNIVIT' FOR CHILBLAINS

Pernivit is an effective preparation for the treatment and subsequent prevention of chilblains. It utilises the vasodilator properties of nicotinic acid and the effect of vitamin K in maintaining normal blood coagulability and vascular permeability.

Itching and inflammation are quickly relieved. Dosage is from two to six tablets daily according to the severity of the case.

'PERNIVIT'

Pernivit tablets, containing Acetomenaphthone B.P. and Nicotinic Acid B.P., are available in bottles of 50 and 500.

Literature and specimen packings are available on request.

THE BRITISH DRUG HOUSES LTD. (Medical Department) LONDON N.1

Prvt/E/543

It depends what you mean by 'tonic'

SOME SAY that strychnine is the only true tonic. Others use the word tonic more widely, to include all those drugs and combinations of drugs which improve the well-being of the patient during convalescence and at other times when vitality and resistance are low.

'Epitone' is a well balanced tonic preparation which presents ferrous iron in an active form together with the more important factors of the Vitamin B complex, with strychnine and caffeine. In bottles of 8 and 16 fl. oz.

'EPITONE' tonic & restorative

8123

have seen a resolute though uncomfortable nurse who had undergone thyroidectomy bravely tolerating an endotracheal tube several hours after recovering consciousness. The staff had instructions not to remove it until she coughed.

Galley (*Modern Practice of Anaesthesia*, 1949, p. 355) states, "It is well known that even in the conscious patient the larynx has a greater tolerance for foreign bodies which do not move." This is confirmed by Mr. Coldrey's case and an exactly similar one which occurred here recently.

It should be stressed to nurses that difficulty, coughing, straining, and retching are not normal reactions to the passage of a Ryle's tube. When these occur to excess in any patient, particularly in the exhausted, toxic, or otherwise debilitated, the tube should be under suspicion until proved, by positive gastric aspiration, to be in the stomach. Too frequently a negative aspiration is taken to mean that the stomach is empty. How often, if ever, is a stomach really dry? Tranquillity after the correct length of tubing has disappeared is in no way proof of correct position. How many emergency procedures have ended fatally from inhalation of vomitus, in spite of a Ryle's tube carefully strapped to one cheek? Not infrequently it may be too short, too fine, too soft (easily collapsed by negative pressure), or otherwise inadequate in itself. Where the distal end may be is apparently anyone's guess. Coiled in the throat is commonplace, doubled in the oesophagus frequent, and on rare occasions it may be in the trachea. I have known it carefully and purposefully concealed in the cheek—the latter the final attempt of a resourceful patient to escape from his tormenter.—I am, etc.,

Portsmouth.

R. J. HAMER HODGES.

Vomiting during Anaesthesia

SIR,—In his article on "Anaesthesia for Minor Procedures" (February 23, p. 431), Dr. W. W. Mushin writes, "If the patient is known to have had a meal within three hours of the anaesthetic, it is better to postpone the operation rather than to risk the very grave dangers of regurgitation and inhalation of vomit." This statement would seem to imply that a lapse of three hours following the last meal will eliminate the danger of inhaled vomitus. In my experience, this is certainly not the case, and I fear this teaching may give the unwary a dangerous and false sense of security. To give a safe margin the interval should be much longer, for I have learnt by alarming, though happily not fatal, experiences that the stomach may not empty for as long as 12 hours after a heavy meal, especially if the patient has been the victim of trauma and shock, as in road and industrial accidents. In such circumstances, it seems to me, the stomach may empty very tardily. It may empty slowly in other conditions also, since I anaesthetized at midnight an adult male for operation for acute appendicitis, when he vomited copiously the contents of a heavy meal taken at 12.30 p.m.—i.e., 11½ hours before operation. I have had other instances of vomiting long after the accepted interval of three hours, and I feel it is a mistake to teach the occasional anaesthetist he is safe after so short an interval.

Dr. Mushin also states, "In cases of emergency, it is justifiable to empty the stomach by passing a large stomach tube just before the anaesthetic is begun." Here again I feel the inexperienced may be misled, in that, having passed his large tube and failed to aspirate any stomach contents, he may assume the stomach to be empty. Meanwhile it may be heavy-laden, and his tube blocked by a solid portion of stomach content. Such an instance demonstrates the great importance of an accurate history regarding a preceding meal. One should inquire exactly what has been partaken of—then one will know precisely what to expect.

I am myself still unhappy in anaesthetizing the unprepared emergency with, possibly, a full stomach. It is now my practice

To take a precise history of the preceding meal.

To pass a large stomach tube if this history suggests the necessity.

Not to induce with thiopentone.

Not to use relaxants unless certain the stomach is empty.

To induce by inhalation methods in order to have a quick return of the cough reflex in case of vomiting.

To induce on an operating table with shoulder rests *in situ*, to facilitate rapid assumption of a steep Trendelenburg position.

To have efficient suction apparatus ready and at hand.

To delay operation as long as possible, consistent with the interests of the patient.

—I am, etc.,

Tiverton, Devon.

R. E. J. PEMBREY.

Chilblains and Hypothyroidism

SIR,—In the course of an investigation concerned with vasomotor (vegetative) endocrine disturbances and their possible influence on serum cholesterol and proteins, six female members (aged 22 to 52 years) on the staff of this hospital suffering from chilblains were examined as normal controls. Surprisingly, they all had a definite increase of cholesterol, ranging from 265 to 400 mg.%. Two were more of the athletic type, the other four more of the pycnic type. Five of them had a very delicate skin, particularly of the face. None of them showed any obvious signs of hypothyroidism, except their tendency to develop vasomotor disturbances. Their blood pressure was normal, but in three of them the pulse rate was slightly raised. Three of them had scarcely been free from chilblains during last summer and two of these had been treated unsuccessfully with vitamin K.

When the high cholesterol level was discovered, and no other reason for this fact could be seen, the increase in this substance was attributed to hypothyroidism, and a therapeutic experiment was initiated. Two persons (aged 24 and 52) were used as controls and not treated. Subsequently one of them developed chilblains and those of the other, already present, became worse with the progress of the cold season.

The other four persons (aged 22 to 48), including the two who had been treated unsuccessfully with vitamin K, were put on small doses of thyroid ($\frac{1}{2}$ gr. (32 mg.) twice daily). Three or four weeks later there was scarcely any influence on the pulse rate, but their cholesterol values had come down to 240–300 mg.%, and their chilblains began to disappear, although by this time the weather had become colder and more damp.

It is interesting to note that quite a number of textbooks I consulted on endocrinology do not mention chilblains among the signs of myxoedema, although attention is always drawn to the fact that very often the first signs of hypothyroidism are hypersensitivity to low temperatures and the development of vasomotor disturbances in the skin. So possibly in outspoken myxoedema the state of the tissues, of metabolism and of vegetative-vasomotor reactivity are such as not to favour the formation of chilblains.

With regard to treatment, only few textbooks of dermatology mention thyroid as an often but apparently not always successful means of improving or curing chilblains. Gourlay (*British Medical Journal*, 1948, 1, 336), reviewing some of the conflicting papers on the role of the thyroid and the results of thyroid treatment in chilblains, refers also to an observation of Embden (*Münch. med. Wschr.*, 1922, 69, 201). This author, in a short note, mentions that he saw chilblains in a patient suffering from slight hypothyroidism. Treatment with thyroid proved successful. Some patients suffering from chilblains, on whom this form of therapy was subsequently applied, would benefit from it, while others would not. The author was unable to find any differences in the clinical appearances of the condition in his patients; he thought that an examination of the metabolism might help to clear the problem. A few years later, however, Barber (*Lancet*, 1926, 2, 1180) differentiated between two main types of persons suffering from chilblains and their respective treatments: (1) the fat subjects of acrocyanosis, usually women, who react well on thyroid and iodine; and (2) the thin subjects of acrocyanosis, men and women, who react better on calcium, parathyroid, and cod-liver oil.

Thus it would appear that, among the many causes which predispose to the formation of chilblains, one is a certain form or degree of hypothyroidism (primary or secondary) found particularly in women. This may or may not be displayed together with other signs and features of sub-myxoedema. An examination of serum cholesterol with a reliable technique and at an appropriate time (blood should be taken when fasting and not about or during menstruation time; and, of course,

when other factors giving rise to an increase of cholesterol can be excluded) will usually disclose easily the presence of hypothyroidism. In such circumstances the application of thyroid hormone appears to be of value in the constitutional treatment of this condition, alone or together with other more local or symptomatic forms of therapy. It should be borne in mind that the doses I gave were very small, and also that thyroid or thyroxine treatment may not be effective during the first weeks.

Shenley, near St. Albans.

H. H. FLEISCHHACKER.

Plantar Warts in Children

SIR,—Dr. L. Forman's lucid article (March 1, p. 480) is a reminder of the heavy incidence of warts at the present time. Probably well over 50,000 cases of plantar warts in children are occurring annually. New lines of treatment or modifications of well-established procedures are being tried by dermatologists. Children can readily be approached with a stick of carbon-dioxide snow because they understand the implication of freezing. The stick can be utilized not only to produce a blister but also to provide sufficient analgesia to allow for the rapid curettage of a plantar wart.

The following technique has been employed. The child rests prone, and the carbon-dioxide snow stick, of a diameter twice the surface diameter of the wart, is applied firmly for about a minute and a half. With a sharp curette the frozen wart is immediately enucleated and the collar of hyperkeratotic skin cut away with scissors. When vasoconstriction from cold ceases there is brisk haemorrhage, and firm pressure for 15 minutes or more is necessary to stop it. The child walks home, well padded with felt. The advantage of this method is that it deals with the wart at one sitting, that no general anaesthetic is employed, and that the injection of local analgesic into the sole, which may be very painful, is avoided. The "operation" lasts only two minutes and a carbon-dioxide snow stick is quickly prepared.

The practicability of the technique was tried out in 100 successive children who presented themselves at one hospital, and who had one or at the most three plantar warts. The reactions of the children were observed and a questionnaire was sent to the mothers later in which they were asked about pain experienced by the children at the time of operation and afterwards. Ninety-three parents replied. Clinical results were good, two patients returned with a relapse during the investigation, one relapse was elicited from the questionnaire; otherwise "no trace" or a "tiny scar" was recorded. In about 50% of cases no pain at all was experienced at the time of operation, and little pain afterwards. In another 25% though there was some pain the child did not seem to mind. In the remaining 25% there was pain at the time of curettage and after, and a few children were considerably upset; 24 out of 93 mothers stated that they would have preferred a general anaesthetic for the children.

The conclusions reached were: carbon-dioxide snow freezing followed by immediate curettage provides a speedy and effective form of therapy in about three-quarters of cases of plantar warts in children. But when the wart is very large, or extremely painful and tender from previous use of caustics or through undergoing spontaneous inflammatory change, or when the child is very nervous and apprehensive, the procedure is too upsetting; in Dr. Forman's phraseology, it is "best to forbear."—I am, etc.,

London, S.W.2.

MICHAEL FEIWEL.

Congestive and Simple Glaucoma

SIR,—I have read with admiration and interest Mr. S. J. H. Miller's article entitled "Symptomatology of Congestive and Simple Glaucoma" (March 1, p. 456), and would like to congratulate both him and his colleagues on their beautiful studies of ocular tension behaviour and other clinical features in chronic glaucoma both in this paper and elsewhere. These, I think, may well emerge in the future as being of far-reaching and fundamental importance. For some time, however, I have been most unhappy about this classification into congestive and simple glaucoma in the particular sense used by Mr. Miller, which appears to be taken for granted.

Corneal oedema is well known as a frequent though not constant companion of very high intra-ocular pressure. Unfortunately

its appearance has become linked with the word "congestive" and appears, in orthodoxy, to compel the labelling of a case as "congestive." Study of large numbers of cases soon shows us, however, that corneal oedema without actual congestion is in fact a common occurrence. To say that corneal oedema is a warning of a congestive phase sounds rather like the statement that the passage of a Morris Eight down the street is a warning of the approach of an articulated lorry. The fact that one frequently does follow the other seems irrelevant.

For instance, were Mr. Miller's case (Fig. 1) of "simple glaucoma" to develop corneal oedema during a subsequent phase of high tension similar to that shown, is it to be relabelled "congestive"? Alternatively, if it should pass into a true congestive phase (as is possible in experience), should it be relabelled "acute simple glaucoma"? Again, if a case showing the tension curve features said to be those of congestive glaucoma (Figs. 4 and 5) shows, in a subsequent tension curve, a peak at 6 a.m. (as many of mine have done), have we to do more relabelling? The trouble, Sir, is that the closer one examines this distinction the less valid it becomes. It seems that we may safely speak of high tension chronic glaucoma (with or without corneal oedema, and sometimes passing into a congestive phase), of moderate tension, and possibly of low tension chronic glaucoma. But our detailed clinical observations do not at present support the classification into congestive and simple. Nor does our fundamental knowledge yet enable us to adjudicate on this point. Chronic congestive glaucoma is in my opinion probably a categorical misconception. The use of the appellation "simple" for one of the greatest enigmas in ophthalmology seems deplorable.

Space does not permit of a detailed discussion of presenting features (Table III), say to say that I think that periodic or constant aching of the eyes, difficulty with near work, and temporary blurring of vision are such common eye symptoms that in practice they can hardly be useful as indications of a rare disease such as glaucoma. My experience in practice and in clinical research is that the commoner presenting features are:

1. The discovery of cupping of the disk in the course of routine examination.

2. Manifestations of very high tension such as corneal oedema or even a true congestive phase.

3. Approaching blindness—that is to say, the all too common case first seen with one eye blind and the other with extensive field loss.

Only if tonometry becomes practicable on a far wider scale than at present shall we see our cases at a really early stage. This has been abundantly shown by the recent survey undertaken by the National Society for the Prevention of Blindness in the United States of America (see *Amer. J. Ophthalm.*, 1948, 31, 1324). But, of course, the future may reveal some more easily and more widely practicable diagnostic procedure.

Finally, Sir, may I plead with Mr. Miller to differentiate between "increased intra-ocular pressure" and "raised ocular tension"? "Raised intra-ocular tension" is a solecism to which, incidentally, my attention was drawn 14 years ago rather forcibly by the late Mr. Harrison Butler.—I am, etc.,

Oxford.

J. P. F. LLOYD.

Cost of Treatment

SIR,—I should like to point out an apparent error in the letter of Dr. R. McL. Todd (March 8, p. 546). In the discussion of the cost of treating infections with antibiotics, he states the approximate cost of treating an infant weighing 6.8 kg. for a five-day period with "aureomycin," using the accepted dosage (25 mg./kg.), is 27s. 9d. This is not so. The figure should read 6s. 2d., which is the delivered cost of 1 g. of aureomycin to Ministry of Health hospitals which are served directly.

Recent trends clearly show that in infections in which aureomycin is indicated a dosage based on 12.5 mg./kg. body weight is effective.¹⁻⁴ The further saving in the cost of treatment is therefore considerable.—I am, etc.,

Lederle Laboratories Division,
Cyanamid Products, Limited.

Spontaneous Pneumothorax from Secondary Sarcoma

SIR,—The report by A. B. Shaw (*British Medical Journal*, 1951, 1, 278) of a case of spontaneous pneumothorax from secondary sarcoma of the lung, and the apparent rarity of this combination, prompt me to report a further similar case. A single secondary growth appeared six years after amputation of the right leg for synovial sarcoma, with collapse of the opposite chest wall due to an old pleural effusion and pleural fibrin bodies which showed a superficial radiological resemblance to other secondary growths.

The patient, aged 29, had his right leg amputated in 1941 for a sarcoma of the synovial membrane of the right ankle-joint. He remained well following this until four months before admission, when for 10 days he had a fever of unknown origin.

Although he then returned to work he lost weight, but had no other symptoms until eight days before his final admission, when he became rapidly more breathless until dyspnoea occurred at the slightest exertion. He had no cough. On admission he was a pale, extremely ill man, with severe orthopnea. The left chest was collapsed, but with normal air entry and no adventitious sounds. The right upper lobe was hyperresonant, with absent air entry. The right base was dull to percussion, some crepitations were present, and the air entry was diminished. There were no enlarged glands; the liver was not palpable. The urine and the blood count were normal. A radiograph showed a right pneumothorax involving the upper half of the chest. In the right lower lobe there was a shadow about the size of a cricket ball. The mediastinum was displaced to the left. The left chest was collapsed, with gross pleural thickening; two rounded shadows about the size of a penny were present, one adjacent to the diaphragm and the other in the mid-zone.

Temporary improvement followed the aspiration of 700 ml. air from the right pleural cavity. The dyspnoea returned, and 48 hours later a further 1,300 ml. was withdrawn. Aspiration three days later from the same space produced a blood-stained fluid. Several radiographs showed a rapidly increasing fluid level. Attempts at aspiration were unsuccessful, and 18 days after admission thoracotomy was performed, about two pints of clotted blood removed from the pleural cavity, and a large mass of hyperaemic friable growth found to occupy the lower part of the right lower lobe and pleura. Transpleural spread had occurred and the diaphragm was also involved. It was considered impossible to remove the growth. The patient died the following day. At necropsy there was no macroscopic evidence of secondaries elsewhere in the body. Histology of the growth showed degenerate tissue with the appearance of sarcoma, but the type could not be determined. Histology of the bodies from the left lung showed fibroblastic tissues, without evidence of malignancy.

—I am, etc.,
Plymouth.

G. R. STEED.

Notification of Disease

SIR,—May I make some comments and suggestions on the subject of notification of disease, discussed in your leading article (March 1, p. 474)?

1. Statutory notification covers only infectious diseases or conditions possibly due to an infectious cause. For various reasons not all infectious diseases are notifiable.

2. The notification of the first case in the family over a prescribed period should be sufficient for measles. The health department should follow up the family for the further record, in the course of its inquiries. If whooping-cough was not likely to be the subject of an "immunization" campaign I would say the same for it.

3. Similarly, only the first case of dysentery or any acute streptococcal throat infection in a family should be notified, unless the sufferer is a food (including milk) worker, who should in every case be notified.

4. Any case of acute enteritis of uncertain cause should be notified if it occurs in a food worker or within a family in which there is a food worker.

5. Carriers of the intestinal diseases for a period exceeding a prescribed time, differing for different organisms, should be notifiable.

6. The notification of acute primary pneumonia should be abandoned. The notification of erysipelas should be abandoned. Puerperal pyrexia should be redefined—the regulations are too stringent. In any event, the practitioner should be required to state the believed cause.

7. Notification by telephone should be accepted and encouraged. Speed and accuracy are both important.

8. Medical laboratory workers should be required to notify when their findings point to infectious disease (I except venereal disease).

9. Many of us feel it was a grave mistake to divorce the isolation hospitals from the public health departments.

10. Notification of a disease is used (a) to ascertain its incidence (rate and location), (b) as a basis for control, (c) as a basis for further inquiry into the disease. It is the only way all the cases of a disease in the community can be ascertained, and it is necessary even to secure a random sample. It is difficult to justify statutory notification for the purpose (c) above, although very grave diseases susceptible to control could reasonably be held to do so.

11. The M.O.H. is the person statutorily charged with the duty of ascertaining and remedying, so far as practicable, circumstances prejudicial to the health of the inhabitants. Therefore all statutory notifications should go to him, *without exception*. If he does his duty he cannot "play the part of postman" as you suggest. He now regards all disease which may be shown to have as a substantial cause, if indirect, social or environmental factors as susceptible to some degree of control. This outlook has replaced the former, then quite essential, view that his main job was to control the infections. If general practitioners, consultants, and medical officers would work together discussing not only the notifiable but also the non-notifiable infections in the area (and family epidemics might be a fruitful field), and indeed other diseases where social and environmental factors are believed to be significant, further advances, not so spectacular as in the recent past, but very important, might indeed be possible.

—I am, etc.,

Public Health Department,
Exeter.

Is Penicillin Dangerous?

SIR,—I read with considerable interest Mr. J. B. Oldham's letter (March 8, p. 545) on the subject of penicillin cream. It is encouraging to read from a surgeon's pen a conclusion which the dermatologists of this country arrived at some five years ago and which they have been consistently preaching ever since, both to their colleagues in general practice and also in surgery and general medicine. I have always held that the indications for the local use of penicillin in dermatology were few, and with the increasing number of resistant strains of organisms they are becoming fewer.

I had occasion recently to suggest in a letter to a senior medical officer of the Ministry of Health that the greatest single economy in dermatology would be the discontinuance of the use of local penicillin. The economy attained thereby would derive not only from saving of the cost of the penicillin, but also from the saving in time and effort on the part of practitioners spent in treating the resulting sensitization eruptions, and also of a considerable number of man-hours in industry and elsewhere.

It is to be hoped that the voice of the surgeons will carry further than that of the dermatologists.—I am, etc.,

Wolverhampton.

D. E. OAKLEY.

Sulphamerazine Still Dangerous

SIR,—I feel at this time of year it may be opportune to draw attention to the frequent use of sulphamerazine in the treatment of respiratory infections, and the relatively small margin of safety afforded by this preparation against the development of urinary complications. Having just relieved a fifth case of sulphamerazine anuria, and having been called to see two instances of ureteric obstruction due to the drug within the last month, I am prompted to reiterate that extreme care is needed to ensure an adequate urinary output during treatment.

It is generally conceded that, despite its low solubility, sulphamerazine when given in the recommended dosage is reasonably safe provided that a copious water intake is maintained. Supervision of the latter, however, is sometimes difficult, particularly in the patient's home, and vomiting and surface loss, especially in children, may deplete the fluid reserves. In such circumstances the risk of urinary obstruc-

tion is ever present, and, while many doubtless relieve themselves spontaneously with the aid of additional fluid and alkalis, others less fortunate may develop complete ureteric obstruction and anuria requiring urgent instrumental relief. It seems, therefore, that the advantage gained by the more widely spaced dose of this drug should be jointly considered with the absolute necessity for maintaining close observation of the fluid intake and loss throughout treatment. Should the latter present any difficulty the choice of a more soluble sulphonamide may then be well advised.—I am, etc.,

Institute of Urology, W.C.2.

J. D. FERGUSON.

Xylocaine

SIR,—Some time ago I showed in the experimental laboratory that when given by various routes to various species of animal "xylocaine" was twice as toxic as procaine (*Brit. J. Anaesth.*, 1951, 23, 153). On the basis of the clinical evidence then available, however, the two drugs were of approximately equal toxicity when used in the human subject. At the time no apparent satisfactory explanation of this seeming contradiction was available.

For the past few months xylocaine, 0.5% with 1:160,000 adrenaline, has been used for local analgesia in the department of neurosurgery in Manchester. This mixture has produced manifestly better vasoconstriction than the 1% procaine and 0.1% amethocaine used previously with the same amount of adrenaline. It has been known since Braun first used a vasoconstrictor in local analgesia that the effect of such drugs is to reduce the toxicity of the analgesic agent by delaying absorption. Better vasoconstriction therefore means greater reduction in toxicity. The difference in the maximum tolerated dose of xylocaine with and without adrenaline will therefore be greater than the corresponding difference when procaine is considered. It is thus possible to use amounts of xylocaine with adrenaline which by themselves would be dangerous. There are, therefore, very good grounds for Mr. C. Grimshaw's suggestion (March 1, p. 489) that the omission of the adrenaline was to some extent responsible for the fatality reported earlier in your medico-legal columns (February 2, p. 280). Also there is at last a credible explanation of the apparent contradiction that xylocaine is twice as toxic as procaine in experimental animals but about equally toxic in clinical practice.

—I am, etc.,

Manchester.

A. R. HUNTER.

SIR,—We have followed the correspondence on "xylocaine" with considerable interest, as we have used it extensively for the last year. We have found that its rapidity of action, the intensity and duration of its effects, far exceed those of procaine or amethocaine and that there has been no significant toxic effects in the dosage employed (up to 1 g.) other than those attributable to the adrenaline (1:80,000) added to the 2% dental preparation. Consequently we now use it as a routine for surface application, local infiltration, and regional and epidural blocks.

For urethral instrumentation a 2% (plain) solution will rapidly produce effective analgesia, thus avoiding the 15-minute wait which is customary with other agents. By local infiltration its action develops within a few seconds and rapidly diffuses: it is effective for at least an hour with the plain solution and up to four hours with the adrenaline added.

In particular, we have found it of special value in abdominal emergencies occurring in feeble aged patients. Regional nerve block using 0.5% (plain) xylocaine solution gives rapid analgesia and muscular relaxation, and we confirm the observation that several patients have fallen asleep once the actual operation started: in each case they could be roused by the voice. The effect was reinforced, and after-pain prevented, by the use of intravenous pethidine in doses of 25 to 100 mg. The post-operative condition of these patients was incomparably better than that following orthodox general anaesthesia; shock, respiratory depression, and post-anaesthetic vomiting were absent.

In our opinion the introduction of xylocaine marks a definite advance in anaesthetic and surgical technique.—We are, etc.,

JAMES ROCHFORD,
HENRI ROUALLE.

Barnet, Herts.

Whooping-cough Immunization

SIR,—Whooping-cough immunization has had such a chequered career that it was refreshing to read Professor Robert Cruickshank's views in the second part of his article on the pros and cons of immunization (February 2, p. 268). I have unwaveringly inoculated babies of 3 months old for the last six years, in the face of prejudice and opposition from some mothers and the local public health authorities, provided the baby was over 12½ lb. (5½ kg.). The weight is the main consideration after all, for one must have sufficient tissue in the upper lateral quadrant of the buttock to inject ½ ml. and also the antibody response is adequate at that weight.

Having inoculated hundreds of babies, I can say that Glaxo's "combined diphtheria pertussis vaccine" is safe and effective, and that I nowadays treat very few cases of pertussis. The latter are either suppressed pertussis in 3- and 4-year-olds who have not had a booster dose, or else children who have escaped my attentions.

I contend that post-inoculation poliomyelitis was never really proved. Some of the reported cases were wrist-drop, which may have been caused from inoculation into or near the radial nerve. If there were genuine cases they might be coincidental, and, anyway, why should not vaccination produce similar sequelae? As this piece of research was done through my local clinic I heard several different points of view.

Lastly, the local authorities should be induced to pay more than they do for the work of immunization, because it often involves a call on the mother.—I am, etc.,

Hampton Hill, Middlesex.

I. E. D. McLEAN.

Complications of Arsenotherapy

SIR,—The interesting article by Dr. M. G. Nelson (February 9, p. 300) prompts me to record a similar case of agranulocytosis and spontaneous bruising complicating arsenotherapy. In my case, however, there was no thrombocytopenia or other clotting abnormality.

The patient was a woman of 44 who, following an attack of acute bronchitis, lapsed into a state of subacute pulmonary congestion which persisted for many months. All investigations proved negative and it was difficult to account for the condition, which was resistant to all forms of antibiotic and other therapy. There was no evidence of left ventricular failure. As a last resort it was decided to give her a course of intravenous neoarsphenamine, which was successful in resolving the condition. However, following the last injection (2.4 g. total) she developed a moderately severe generalized dermatitis, which cleared up with antihistamine treatment. One month later she complained of painful and swollen knees and ankles, associated with the appearance of spontaneous bruises. The latter were numerous, measuring 1-2 in. (2.5-5 cm.) in diameter and occurring mainly on the limbs. There was no actual purpura, but the capillary-fragility test was positive. Blood investigation revealed: Hb, 13.4 g. per 100 ml. (90%); erythrocytes, 6,160,000 per c.mm.; leucocytes, 3,700 per c.mm. (polymorphs 64%, lymphocytes 25%, monocytes 6%, eosinophils 5%); platelets, over 240,000 per c.mm. Clotting time (Dale and Laidlaw) 2 min. 5 sec.; bleeding time 2 min. 15 sec., prothrombin time normal compared to control.

No specific treatment was given and two weeks later the leucocyte count was down to 3,000 per c.mm. (polymorphs 50%, lymphocytes 46%, monocytes 4%). Four weeks after this the symptoms had resolved, the leucocyte count being 4,200 per c.mm. (69% polymorphs). Four months later severe spontaneous bruising recurred. It was difficult to be certain whether this was prior to or following a week's treatment with vaginal acetarsol for leucorrhoea. The white cell count was now 4,500 per c.mm., with 28% polymorphs, 68% lymphocytes, 2% monocytes, and 2% eosinophils. A course of pentose nucleotide, 10 ml. intramuscularly daily for two weeks, was then administered. On conclusion the leucocytes numbered 4,100 per c.mm. (63% polymorphs). Spontaneous bruising is considerably improved at the present date, although still occurring to a small extent.

—I am, etc.,

Twickenham.

DAVID WHEATLEY.

in urinary-tract infections

'Mandelamine' is effective against a wide range of organisms commonly encountered in urinary-tract infections. This effectiveness is rarely, if ever, marred by the development of drug-resistance, and organisms that are already resistant to the sulphonamides or streptomycin remain fully susceptible to 'Mandelamine'.

'Mandelamine' therapy is safe and simple—3 to 4 tablets t.i.d. Neither regulation of diet or fluids nor accessory acidification of the urine are required (except when urea-splitting organisms are present), and undesirable side-effects occur so infrequently as to be negligible.

'MANDELAMINE'

Each enteric-coated tablet contains 0.25 g.
(gr. $3\frac{3}{4}$) methenamine mandelate

MENLEY & JAMES, LIMITED, COLDHARBOUR LANE, LONDON, S.E.5

'Mandelamine' is the registered trade mark of Nepera Chemical Co., Inc., New York

NYXOLAN - Hommel

in OXYURIASIS

Following extensive animal and human clinical trials, 'Nyxolan' now provides entirely non-toxic, freely acceptable, reliably therapeutic management of threadworm infestation

★ ★ ★ ★ ★ ★ ★ ★ ★
★
★ **'NYXOLAN'**
★ is non-toxic; dietary
★ regimen unnecessary. ★

★ **NYXOLAN** is a new, clinically proved anthelmintic

COMPOSITION. 'Nyxolan' is a pleasantly tasting syrup containing 0.4% of aluminium 8-hydroxyquinoline sulphate $[Al (C_8H_6ON)_3 \cdot 3H_2SO_4]$

CLINICAL OBSERVATIONS. Significant trials in medical institutions show that 'Nyxolan' is a most reliable anthelmintic when used alone, i.e. without supportive purgation, enemas or anal counter-irritants. Abstracts from literature describing clinical results are available on request.

ADVANTAGES. 'Nyxolan' is not a dye; it is non-arsenical; it does not induce diarrhoea; dietary regimen is not necessary to its successful employment. It is entirely acceptable, even to infants.

INDICATIONS. Present clinical experience with 'Nyxolan' refers to *Oxyuris vermicularis*. Besides its indication in oxyuriasis 'Nyxolan' is the preferred treatment in cases of suspected oxyuriasis.

FORM AND POSOLOGY. 'Nyxolan' is presented in liquid form, the active ingredient being incorporated in a syrup which ensures ready acceptance by children.

Daily dosage of 'Nyxolan' is:—Children under 6 years, 1 dessertspoonful thrice daily; Children over 6 years, 1 tablespoonful four times daily; Adults, 2 tablespoonfuls thrice daily.

PRESENTATION. Bottles of 8 fluid oz. net. Literature and samples available.

★ 'Nyxolan' is widely used in other countries under the name 'Aloxyn'. Not publicly advertised.

HOMMEL'S HAEMATOGEN & DRUG CO., 121 NORWOOD RD., LONDON, S.E.24.

Funnel Chest

SIR,—With reference to the operation for this condition which has been developed in America and described in your annotation (February 16, p. 370), let us pause and marshal the facts before adding another scalp to the victims of medical mythology. This is an occasion for co-operation between all branches of medicine. The paediatrician sees only young and healthy children, careless of the deformity and unaffected physically by any displacement of the heart, possessors perhaps of systolic murmurs, but fortunately not now made into invalids on that account. He can only regard operation as of unproved benefit. The surgeon sees only cases which are presented to him hungry for cosmetic cure, or, Munchausen fashion, seeking another scar on the body to match up with the scars on the mind. In America, where it is more important to have a standard physical equipment, the cosmetic appeal must be even greater. The physician in charge of the elderly sees any cases of heart failure due to this condition that may occur. May we have some evidence about this? Or are such cases merely "snow on the boots" which no one has ever seen?

A. Ochsner and M. De Bakey (*J. thorac. Surg.*, 1939, 8, 496) state that the symptoms are, "Cardiac disturbances such as dyspnoea, palpitation, precordial pain, and in rare instances decompensation; pulmonary disturbances such as dyspnoea, cyanosis, cough, and diminished vital capacity, and digestive disturbances such as dysphagia and dyspepsia. In general these patients are of asthenic habitus and usually display characteristic weakness and debility."

These sound very like the symptoms of effort syndrome, or just plain anxiety neurosis. Is operation going to cure them all, and if so would not elementary psychotherapy do the same with less risk?—I am, etc.,

Bath.

H. R. E. WALLIS.

POINTS FROM LETTERS

Ryle's Tube in the Trachea

Dr. C. D. T. JAMES (London) writes: It is a fact that in an anaesthetized patient with an endotracheal tube in place a Ryle's tube passed blindly almost invariably follows the path of the tube already in place. The dangers are obvious, and it behoves any anaesthetist who is asked to pass a Ryle's tube on such a patient to do so under direct vision.

Death under Anaesthesia

Dr. J. NOEL JACKSON (Whitley Bay) writes: From time to time there are reports of deaths under anaesthesia. Some of them have the common factor of death following immediately upon the administration of stimulants intended to raise blood pressure and so forth. Sometimes these measures have been taken before sending the patient back to the ward. . . . Is it too much to suggest that where there is a theatre there should also be a recovery ward adjacent, so that skilled use of posture and the less drastic devices of resuscitation under expert supervision become the rule and not the exception?

Debauchery of Honest Words

Professor A. D. GARDNER (Oxford) writes: I cannot entirely agree with Dr. H. G. Calwell (March 8, p. 548), who feels that "spectrum of antibacterial activity" is an objectionable misuse of the word "spectrum." It seems to me a figure of speech which does not debase the meaning of the word. But the snappy title of his letter moves me to invite your condemnation of an undoubted debauchery of a precise and essential word, "epidemiology," which is being inflated by writers on social medicine and similar subjects to include the study of the frequency or incidence of diseases whether epidemic or not. The right and, as I thought, obvious meaning of epidemiology is given by the shorter *Oxford English Dictionary* as "the study of epidemics," and an epidemic is "a disease prevalent among a people or a community at a special time, and produced by some special causes not generally present in the affected locality." Therefore, to speak of the epidemiology of coronary thrombosis, or of hare-lip, or diabetes, or of any non-epidemic disease is a debasement of the currency of thought. It is of no use saying that the word is being used in its wider sense. It has no wider sense.

Obituary

G. W. M. FINDLAY, C.B.E., M.D., D.Sc., F.R.C.P.

The death of Dr. G. W. M. Findlay on March 14 was recorded in the *Journal* of March 22 (p. 658). We are indebted to Professor B. G. Maegraith for the following appreciation:

I first got to know George Marshall Findlay really well when he went to West Africa during the war. He was attached to the G.H.Q., West African Forces, as consulting physician. For the ordinary man it would have constituted a full-time job to deal with the medical problems presented by the assembly of a large European force in such an environment. Findlay was no ordinary man, and almost before they knew it the local authorities had provided part of the Medical Research Institute for work on haemolysis, malaria, viruses, and anything and everything else that turned up. This work was continued there, and in the later established laboratory in a nearby general hospital, until he left in 1945. During that period Findlay stimulated considerable research activity amongst work-hungry young Service personnel, and his kindness and enthusiasm will long be remembered by those who worked with him.

Findlay was a voracious reader. He was interested in everything. His knowledge of medical literature was encyclopaedic and his memory astonishing. Medical textbooks and journals, books, and papers on anthropology, natural history, and local history were all absorbed in turn, abstracted, and transcribed neatly in his clear, round hand into school notebooks. He once told me he had been keeping notes of this sort since he was a boy. If his notebooks have been kept they must represent a unique and wondrous store of knowledge that I hope will be preserved.

Findlay's approach to medicine was rather that of an eighteenth-century natural historian. All sides of the problem interested and excited him, and he attacked his work with a gusto and enthusiasm which sometimes seemed a little to outweigh his critical judgment. He absorbed ideas like a sponge. Every bit of information was useful and important in its proper place, no matter where it came from, and to him the natural place for it was in some permanent record. The long list of clear, well-written scientific papers which are credited to him, and particularly the remarkable new edition of his book on chemotherapy upon which he was still engaged when he died, remain as a memorial to him, but those who knew him will, I think, prefer to remember the man. Highly intelligent, amusing, intolerant of interference (especially official) or hindrance, his was the kind of inspiring, irritating, restless personality that influenced and stimulated everyone who came into contact with him. Findlay was certainly one who did not leave medicine where he found it.

KONRAD DOBRINER, M.D.

Many engaged in the biochemistry of cancer and related fields will have received with deep regret the news of the death in New York on March 10 of Dr. Konrad Dobriner of the Sloan-Kettering Institute and Memorial Hospital Centre. Born at Elberfeld on October 14, 1902, Dr. Dobriner graduated from the University of Freiburg in 1925, and shortly afterwards received the degrees of doctor of medicine and doctor of medical

science of the University of Munich. After emigrating to the United States in 1933, he worked as a research fellow in the University of Rochester Medical School from 1934 to 1936, and later for a period of three years at the hospital of the Rockefeller Institute. In 1939 he was appointed head of the department of research chemistry of the Memorial Hospital, and became a member of the Sloan-Kettering Institute in 1947, with the additional title three years later of Associate Professor of Medicine in Cornell University Medical School.

Dr. Dobriner was the author of some eighty contributions to the medical and scientific literature, either alone or jointly with such workers as C. P. Rhoads, L. F. Fieser, S. Lieberman, R. N. Jones, T. F. Gallagher, and C. C. Stock. His earlier interests lay in the field of porphyrin excretion, and later topics included the metabolism of specific carcinogens such as 1:2:5:6-dibenzanthracene, β -naphthylamine, and dimethylaminoazobenzene, and the carcinogenicity of benzidine. Of recent years he had contributed largely to the establishment of the patterns of urinary excretion of the steroid hormones in normal and pathological states, the application of infra-red spectroscopy to steroid structure and metabolism, and the study of the effects of cortisone and related steroids on the growth of experimental tumours. From these later researches he was gradually evolving a view and interpretation of the role of adrenal cortical dysfunction in the inception and development of malignant disease as a whole. A welcome visitor to England, he had taken part in various symposia at the Ciba Foundation and at other meetings elsewhere, and it was hoped that he would be present at the International Congress of Biochemistry to be held in Paris this summer. Such was not to be, and many, not only in the country of his adoption but far beyond it, will mourn "Dobie" as a valued colleague and generous friend. He is survived by his wife and two young children.—A. H.

MICHAEL HESELTINE, C.B.

The death of Mr. Michael Heseltine on March 13 was recorded in last week's *Journal* (p. 663). We are indebted to Sir Henry Cohen for the following appreciation :

The General Medical Council exerts, and is by statute entitled to exert, a greater influence on medical education and on standards of professional conduct than any other body. For the past 18 years few lives could have been more closely intertwined than those of the Council and Michael Heseltine. Others have rightly paid tribute to his superlative gifts as an administrator and to his unrivalled lucidity as a draftsman; and it is proper to acknowledge that during his term of office as Registrar, which saw fundamental changes in the constitution of the Council and its committees, it was his contribution more than any other which ensured that the transition would be smooth and the outcome workable.

But Michael was more than a great administrator. He had a genius for friendship; he was a humanist, a scholar, a wit, a historian, and a bibliophile. I recall how warmly he welcomed me as a new member of the Council, appointed during the war, shortly after the Council's offices had been bombed, and while he was carrying a well-nigh overwhelming burden of responsibility with a depleted staff; and, later, how many were the generous gifts of time and advice which were to flow from that refined and fastidious mind.

In 1946 he accompanied the President and four members of the Council on a visit to Canada and the U.S.A. to examine medical education. The smooth path we were able to follow in comfort, indeed in luxury, owed much to Michael's charm and irresistible personal magnetism. It was on this trip that was conceived the project to which he was to devote the early years of his retirement—a history of the Council and its influence on medical education.

He had great courage. He knew the nature of the illness some years ago which demanded radiotherapy. From the necrosis of the jaw which followed he suffered constant and, at times, agonizing pain; yet he persevered with all his tasks and met us all with his customary cheer and equanimity.

A personal note is not the place for an inventory of his remarkable and exceptional qualities of mind and heart. Nor, indeed, would he have wished it. He would certainly have urged that there be "No flowers, by request," for he had that essential humility which is the surest shield against intellectual arrogance.

Petronius (of whose works Michael contributed a masterly translation to Loeb's Classical Library) wrote in his *Satyricon* that "a man must have his faults" (*sed sibi quisque peccat*). Be this as it may, it can be said of Michael, without any equivocation whatsoever, that amongst members of the Council he leaves no resentments and no enmities; nothing but the memory of a gracious, witty, brave, and generous character who served them and, through the Council, our profession, with unstinted devotion and unsurpassed distinction.

Dr. H. Guy Dain writes: Everyone who has had the privilege of working with Heseltine must have fallen under the influence of his charm and kindly friendliness. To know him was to find a friend, a friend who could always be relied upon to be helpful.

His association with doctors and their problems was long and valuable. As one of the team of young Civil Servants brought together by the late Sir Robert Morant to work Mr. Lloyd George's National Health Insurance scheme, he was concerned from the beginning with the problems of the medical service. During his period of service at the Ministry of Health he took part in the discussions and developments of the "panel" service in its early days. Then, as always, he was helpful and approachable.

Deciding to leave the Civil Service, he was appointed Registrar to the General Medical Council, where his contact with doctors was not only continued but became more intimate. With the background of his experience at the Ministry of Health he interviewed both doctors and the public with sympathy and understanding. He was a master of the English written word, and his memoranda and documents were models of construction. He made himself acquainted with all the intricacies and pitfalls of the Medical Acts, so that when a new Medical Act was passed in 1950 it was Heseltine who had thought it out and worked out all the detail.

During a recent dangerous and painful illness, his friends on the General Medical Council were much impressed by the courage and fortitude that he displayed. They were delighted with the recovery he made, and when his retirement became due last year it seemed he would be able to enjoy it in reasonable health. The news of his death comes as a great shock to the Council.

Dr. EDWARD DAVISON SMITH, of Whickham, Newcastle-upon-Tyne, died on December 26, 1951, of coronary thrombosis, as his father and two brothers had done before him, and like them he died in harness. He was 67 years of age. Born into a family of doctors and brought up in an atmosphere of medicine, he naturally took to it as a vocation. He graduated M.B., B.S. at Durham University in 1908. After serving for a year as house-physician and surgeon in the Royal Victoria Infirmary, Newcastle-upon-Tyne, and going on a trip to the Far East as a ship surgeon with the Blue Funnel Line, he settled down in practice with his father in the halcyon days before the latter had changed horses for cars. In the early days he did a little surgery, and a colleague vividly remembers 40 years ago his operating for a strangulated femoral hernia on an old lady lying on a feather bed. She made an uninterrupted recovery. He served throughout the first world war in the R.A.M.C. and took part in the Gallipoli landing. He was president of the Medical Institute in Newcastle, a member of the B.M.A. and the Northern Counties Medical Society, and a regular attendee at their scientific and clinical meetings. A general practitioner in the old tradition, Smith knew his patients to the third and fourth generation, and gave them not only of his clinical best, but made himself their trusted guide, philosopher, and friend. For many years he was the senior of a particularly happy partnership with his two brothers, and latterly with his nephew and another younger man. Intensely loyal to his colleagues, his enthusiasm never waned and he was at all times willing to help his juniors with a worrying case. Recently his cardiac condition worsened and increasing dyspnoea seriously limited his working capacity. He carried on to the end with a fearlessness and courage and unfailing cheerfulness of disposition which were an inspiration to all who knew him. He is survived by his wife, to whom we offer our deepest sympathy.

By the death of Dr. C. H. HALL at the ripe age of 84 the medical profession in West Hertfordshire has lost its doyen and many of its members have lost a personal friend. Charles Herbert Hall was educated at the University of Glasgow, where he graduated M.B., C.M. in 1890, proceeding M.D. in 1901. After practising for a short time in the north of England he settled in Watford in 1891, at that time a small market town in the country, very different from the large industrial centre it has since become. Dr. Hall soon developed a large and active practice and in addition held various appointments, including those of medical officer to the old St. Pancras Schools at Leavesden and to the London Orphan School, and physician to the Cottage Hospital, which later developed into the Watford Peace Memorial Hospital. On reaching the retiring age he was elected consulting physician to the latter. He formed and directed a local branch of the St. John Ambulance Brigade, and he became a governor of the Watford Grammar School for Boys and was closely associated with the Watford School of Music. His medical colleagues, however, will chiefly remember him for his successful efforts in promoting amity and friendliness among the medical practitioners of the district. He achieved this partly by quiet contacts with individuals, but mainly by the encouragement and stimulation of the long-established West Herts and Watford Medical Society, which, under his wise guidance, became a flourishing and lively centre for academic and social gatherings. He became secretary of the society on September 18, 1896, and held the office for the record period of 51 years and was able to be present at its centenary dinner in 1950. He was happily married and founded a medical family, one daughter becoming a hospital almoner and another a radiographer, while his son and grandson are both doctors practising in Watford.

Dr. HENRY CARDEN PEARSON, who died on February 18, aged 77, was educated at the University of Edinburgh, where he graduated M.B., C.M. in 1895. After holding appointments at the Royal Hospital for Sick Children, Bristol, at

Birkenhead Borough Hospital, and at Staffordshire General Infirmary, he took the F.R.C.S.Ed. in 1899, and in the same year entered into partnership with the late Dr. A. H. Thompson, of Darlington, who died last August at the ripe age of 96. Dr. Pearson became house-surgeon at the old Greenbank Hospital, Darlington, in 1901, and was a surgeon at the Memorial Hospital there until 1934, when he became consulting surgeon. He was orthopaedic surgeon from 1920 until his retirement in 1939, and was the founder of the orthopaedic department at Greenbank Hospital. One of his greatest interests outside his profession was the Darlington Rotary Club, which he helped to found in 1922. He was president in 1926, and it was as chairman of the club's community service committee that he became actively engaged in work among old people, an interest which occupied a good deal of his time and enthusiasm in recent years. After helping to found the Aged People's Welfare Council he became chairman of the committee controlling nine clubs for old people, an office he held until his death. He was an active member and Past Master of the Marquess of Ripon Lodge of Freemasons, and had been an official of the Provincial Grand Lodge of Durham. When the British Medical Association met at Newcastle-upon-Tyne in 1921 he represented his constituency at the Annual Representative Meeting and was vice-president of the Section of Urology. He was also chairman of the Darlington Division from 1942 to 1945. His zest for life and his friendliness and breezy vigour will be much missed by colleagues, patients, and fellow-townpeople alike. Memorials to his professional work already exist, and others in recognition of his social welfare work are projected. He leaves a widow, two sons, one of whom, Dr. R. C. M. Pearson, is medical officer of health for Watford, and one daughter.

The sudden death of Dr. F. DE R. MARTYN on March 4 has caused much sorrow throughout the Spalding district of Lincolnshire, where he was well known. Frank de Récourt Martyn was born at Lincoln on August 18, 1877, the son of a former deputy chief constable for Lincolnshire, and was educated at Lincoln Grammar School. He received his medical training at Westminster Hospital, and qualified M.R.C.S., L.R.C.P. in 1902. Before moving to Moulton he was in practice at Sutton-in-Ashfield, Nottinghamshire. While there he became a member of the Nottinghamshire County Council and chairman of the district school managers. During the war of 1914-18 he was a captain in the R.A.M.C. and served in Mesopotamia and in India, and in the last war he was medical officer to the 2nd Holland (Spalding) Battalion of the Home Guard, holding the rank of major. A Freemason, Dr. Martyn also took a keen interest in the welfare of ex-Servicemen, and was vice-president of the Moulton branch of the British Legion. He leaves a widow, two daughters, and three sons, one of whom is Dr. Gwyn Martyn, of Sale, Cheshire.

By the sudden death on March 4 of Mr. W. MARTIN MUIRHEAD ophthalmology in the United Kingdom has lost a pivotal figure and many ophthalmologists a warm-hearted friend. Educated at Wesley College, Sheffield, and at the University of Sheffield, William Martin Muirhead graduated M.B., Ch.B. in 1911. After resident posts at Sheffield Royal Hospital his interest turned to ophthalmology, and he obtained a position which to-day would be called a registrarship. He held this post until he joined the R.A.M.C., in which he served from 1916 to 1921, for much of the time as an eye specialist. On demobilization he worked for two years in the anatomy and physiology departments at Guy's and St. Thomas's hospitals, and then held out-patient and resident posts at Moorfields, taking the D.O.M.S. of the Royal Colleges in 1927. In that year he was appointed honorary ophthalmic surgeon to Chesterfield and North Derbyshire Royal Hospital, and he held this appointment, together with that of oculist to Chesterfield education committee, until his death. In 1939 he became honorary ophthalmic surgeon to the Rotherham and Worksop hos-

pitals. His brother then joined him in practice, and they jointly provided a remarkable example of partnership in ungrudging and organized service to the area. A man of excellent clinical sense, with an unwearying capacity for work, Muirhead maintained his interest in scientific ophthalmology and cherished his links with the London of his earlier years and the chiefs he had served there. His knowledge and ability found their proper scope when he succeeded the late Dr. P. J. Hay in 1943 as secretary of the North of England Ophthalmological Society, of which he was president in 1938-9. This difficult succession and onerous responsibility he fulfilled with outstanding success, and he maintained the activity and traditional influence of the society at its old high level. To this duty he last year added the treasurer'ship of the Midland Ophthalmological Society. Meetings of ophthalmological societies, their scientific interest and the personal associations they provided, were a delight to him, and it was unusual for him to miss any meeting in London and unthinkable if it was in the Midlands or the North of England. When the British Medical Association met at Liverpool in 1950 Muirhead served as a vice-president of the Section of Ophthalmology. To travel with him in the United Kingdom or abroad was a constant pleasure and, incidentally, a guarantee that all doors would be opened in welcome. The kindness of his nature shone in all he did, but it was only in working with him on a society committee that his thoughtfulness and his skill in planning to draw out and encourage the diffident or neglected (or neglectful) member were realized. His modest, kindly, and widespread influence was a unifying factor among British ophthalmologists, and, while many will greatly miss him on personal grounds, many more will feel his loss to the specialty.—E. G. M.

Dr. Lawson L. Steele (Blyth, Northumberland) writes: The late Dr. ELDRED CURWEN BRAITHWAITE, whose death was recorded in the *Journal* of February 16 (p. 389), was contemporary with me at St. Bees School, Cumberland, and was noted even in those early days for his courage and cheerfulness. He took on a notorious bully, and in a fight lasting nearly half an hour so subdued the bully that life afterwards was much happier for many smaller boys. He was in the rugby fifteen, and was one of the best half-backs the school ever had. One summer on holiday in Cumberland after I had dived into 30 ft. of water from a height of 30 ft. he not only emulated my feat but persuaded his daughter to perform the dive backwards, thus implementing his frequent saying, "Everyone should be made to be tough." He admired St. Bees School and Sedburgh School for their Spartan qualities. His scholastic achievements were worthy of the sixth form to which he attained, and my Latin prose was frequently improved by his help. It is hard to believe that he has gone; one expected that such a man would have reached his century.

Medico-Legal

DEATH AFTER 19 YEARS FROM TOOTH IN LUNG

[FROM OUR MEDICO-LEGAL CORRESPONDENT]

In March, 1932, Cyril Brown, a wheelwright aged 27, was advised by his doctor to have all his teeth extracted because they were in a very bad condition as a result of neglect, and his gums were infected. The extraction was carried out under an open ether general anaesthetic in bed at his home. All the teeth were present and were extracted at once. After the extractions had been completed the doctor who was giving the anaesthetic got the dentist to help him to raise the foot of the bed to relieve cyanosis which the patient was then experiencing.

Mr. Brown was in due course fitted by his dentist with vulcanite dentures, and continued to carry on his calling of wheelwright until in June, 1951, he began to be seriously troubled by a cough which kept him awake at night. On June 22 he had to go to bed: he was admitted to hospital, but in spite of an operation on July 18 he died on July 22.

On July 24 Dr. J. Edwards, of Sheffield Royal Hospital, performed a necropsy. He found that death was due to the bursting of cerebral abscesses into the lateral ventricles of the brain. Since there was no local cause for the pus in the brain, Dr. Edwards concluded that the infected material had probably come by the blood stream, and he investigated the lungs. At the base of the right lung, in the bronchus about 2½ in. (6.3 cm.) from the tracheal bifurcation, he found a collection of pus and in it a hard object.

This hard object turned out to be the root of a tooth, the crown of which had been destroyed by decay or possibly trauma. It was probably the first upper right premolar, and could have been dislodged by the gag during the extraction 19 years before and inhaled while under the ether anaesthetic. Although neither doctor nor dentist could recollect a tooth having been lost, the cyanosis might have been caused by inhalation of the tooth. There was no other explanation of its presence in the lung put forward at the inquest. According to the dead man's sister, it had been a family joke that one of his teeth had been lost.

Dr. Edwards said that he had never known a similar case, but had known of a part of shell casing remaining embedded in the lung for 12 years, although in that case it had entered through the chest wall. In his opinion death was due to the bursting of the abscesses, caused by bronchiectasis, which in turn was caused by the tooth. He could see no reason why the condition should have developed suddenly after the tooth had been in the lung for no less a period than 19 years.

Medical Notes in Parliament

ADJUDICATION—THE MINISTER'S STATEMENT

In a statement to the House of Commons on March 25 Mr. CROOKSHANK said: "I think the House should be informed at once of the result of the claim by general medical practitioners for increased remuneration in the National Health Service. As the House is aware, the late Government agreed to refer the doctors' claim to an adjudicator on the understanding that his award would be binding on both parties, subject to agreement being reached on an improved method of distributing doctors' incomes. The present Government continued these arrangements, and Mr. Justice Danckwerts was appointed to act as adjudicator.

"The Secretary of State for Scotland and I have now received the Adjudicator's award. Its precise effect can be determined only after more detailed study, but broadly it amounts to the award of an additional £9½m. remuneration for the year 1950-1 (the year on which the award is based) with corresponding increases for previous and subsequent years.

"While, as I say, the full calculations have yet to be made, I feel I should inform the House that—in very approximate terms—this may involve an additional charge on the Exchequer of as much as £40m. in the coming financial year to cover the period back to July 5, 1948. This means that, in spite of the serious measures of economy which have already been proposed to restrain Health Service expenditure within a ceiling of £400m., it will be necessary to seek a Supplementary Vote for this additional amount."

Dentists

In the House of Lords on March 18 the Dentists' Bill was again examined on report. Many amendments were made,

CYTAMEN

VITAMIN B₁₂

...from strength to strength

SOON AFTER Glaxo Laboratories isolated vitamin B₁₂ in 1948, decisive evidence confirmed that this new substance was the long-sought active principle of liver. Subsequent knowledge of non-liver sources of the vitamin led to the introduction of Cytamen, with a standardised potency of 20 micrograms per cc.—substantially higher than that of most liver extracts.

Since then, progress with Cytamen has set an ever-quicken pace for developments in anti-anaemia therapy. Today, Cytamen is pure crystalline vitamin B₁₂ in solution and is issued in three strengths, which provide a flexible means of combating pernicious and other megaloblastic anaemias. The two higher potencies, in fact, represent a far more concentrated attack than was ever accomplished, or even practicable, with liver extracts.

CYTAMEN

Trade mark

THREE STRENGTHS: 20, 50 and 100 micrograms vitamin B₁₂ per cc.
Boxes of six 1 cc. ampoules

Vitamin B₁₂ is available also for oral dosage:

CYTACON Tablets each contain 10 micrograms vitamin B₁₂: in bottles of 50 and 500.
CYTACON Liquid contains 25 micrograms vitamin B₁₂ per fluid drachm: in 6-oz. bottles.
CYTACON is intended for nutritional purposes—not for anti-anaemia therapy.

GLAXO LABORATORIES LIMITED, GREENFORD, MIDDLESEX. BYRON 3434

Viscopaste & Ichthopaste

TRADE MARK

BANDAGES

**PRESCRIBE THESE BANDAGES
BY NAME
ON N.H.S. SCRIPTS**

Viscopaste and Ichthopaste bandages conform fully to the Drug Tariff specification for Zinc Paste Bandage (Drug Tariff) and Zinc Paste and Ichthammol Bandage respectively. They are recommended as adjuvants in the supportive treatment of varicose veins and their complications by elastic adhesive bandaging, and as a support in the after-treatment of below-knee fractures.

*Descriptive literature may be obtained, upon request,
from the Medical Division of the Manufacturers*

Viscopaste and Ichthopaste bandages are made in England
by T. J. SMITH & NEPHEW LIMITED, HULL, and distributed throughout the world

almost all of a drafting nature and moved by the Earl of Onslow, who was in charge of the Bill. In Clause 18 Lord Onslow moved to provide that the regulations should not permit a member of any class of auxiliary to undertake the extraction of teeth other than deciduous teeth.

The committee agreed to the amendment.

Lord Onslow later moved an amendment to provide that if any member of a class of ancillary dental workers used any title or description to suggest he possessed a status or qualification connected with dentistry other than that which he in fact possessed he should be liable on summary conviction to a fine not exceeding £50. Where the regulations did not provide for a roll or record of the class in which particulars of professional status and qualifications might be entered the subsection would still take effect.

Lord Webb-Johnson asked whether Lord Onslow thought the use of the word professional was appropriate.

Lord Onslow thanked Lord Webb-Johnson for bringing up this point. He said the Minister would fully consider it when the Bill went through the House of Commons.

Lord Onslow moved to insert after Clause 25 a new clause setting out the conditions under which students might undertake dental work. He said the amendment was really a redrafted one to meet a point raised by Lord Webb-Johnson which the Government had accepted in principle on the committee stage. The House agreed to this amendment. Other consequential amendments were made and the report stage closed.

Prescription Charges

Brigadier FRANK MEDLICOTT, on March 20, asked the Minister of Health what action he was taking on the representations received from the medical profession objecting to the proposed arrangements for the collection of prescription charges by dispensing practitioners. Mr. H. F. C. CROOKSHANK replied that he was about to discuss the matter with representatives of the British Medical Association.

Mr. GEOFFREY DE FREITAS asked what representations had been received from local medical committees in Lincolnshire that dispensing rural practitioners should not be made responsible for the collection of 1s. for medicines dispensed.

Miss PAT HORNSBY-SMITH replied that one of these committees had represented that dispensing doctors should not be responsible for the collection of the charge. Representations made by the Trades Union Congress against the proposed Health Service charges were discussed by Mr. Crookshank on March 19 at a meeting with representatives from the T.U.C.

The National Health Service Bill was discussed on second reading in the House of Commons on March 27 after we went to press.

The Services

The *London Gazette* has announced the following appointments in recognition of non-operational services in Japan in connexion with operations in Korea:

O.B.E. (Military Division).—Major (Temporary Colonel) C. W. Nye, E.D., R.A.A.M.C.

M.B.E. (Military Division).—Lieutenant (Temporary Major) J. W. F. Lloyd, R.A.A.M.C.

Major-General F. Harris, C.B., C.B.E., M.C., late R.A.M.C., has been appointed Director-General, Army Medical Services, with the rank of Lieutenant-General from April 1, in succession to Lieutenant-General Sir Neil Cantlie, K.B.E., C.B., M.C., late R.A.M.C.

Colonel J. E. Rusby, M.C., T.D., J.P., R.A.M.C., T.A., has been appointed Honorary Colonel of a T.A. Unit, in succession to Lieutenant-Colonel (Honorary Colonel) A. C. Haddow, T.D., R.A.M.C., T.A., whose tenure has expired and who retains the rank of Honorary Colonel.

Flying Officer G. A. Faux, M.R.C.S., L.R.C.P., R.A.F., Medical Officer, Royal Air Force Station, Horsam St. Faith, has received the Queen's commendation for brave conduct for helping to remove the crew from a crashed aircraft.

Universities and Colleges

UNIVERSITY OF OXFORD

The Board of the Faculty of Medicine has co-opted Dr. A. H. T. Robb-Smith for the statutory period of two years from the first day of Trinity Term, 1952.

H. R. Ing, D.Phil., has been reappointed Reader in Chemical Pharmacology from October 1, 1952, to September 30, 1959, and the following have been reappointed University Demonstrators in the subjects indicated in parentheses: Dr. R. Barer (Human Anatomy—part-time); Dr. J. M. Walker (Pharmacology); Dr. D. S. Parsons and Dr. R. H. Nimmo-Smith (Biochemistry).

Dr. C. W. Wheeler-Bennett has been appointed representative of the University on the governing body of Steyning Grammar School.

Sir Howard Florey, F.R.S., Professor of Pathology in the University, has been reappointed a member of the University and Employees Joint Committee for four years from the first day of Hilary Term, 1952.

In a Congregation held on March 1, the following degrees were conferred:

D.M.—W. H. H. Andrews, R. J. K. Elliott, H. A. W. Forbes, *A. Batty Shaw, *E. A. Spriggs.

B.M.—*Mrs. Pauline O'Neill.

*In absence.

UNIVERSITY OF CAMBRIDGE

Denis Haigh Marrian, Ph.D., has been appointed an Assistant Director of Research in Radiotherapeutics, from January 1 for five years. (*Corrected announcement.*)

Dr. Vincent Brian Wigglesworth, F.R.S., Reader in Entomology, has been appointed Quick Professor of Biology in the University for the period October 1, 1952, to September 30, 1955, in succession to Professor David Keilin, F.R.S.

Dr. K. C. Dixon has been reappointed University Lecturer in Chemical Pathology from October 1, 1952, and Dr. M. M. Bull University Lecturer in Anatomy from April 1, 1952, both to the retiring age. Dr. C. C. D. Shute has been appointed University Demonstrator in Anatomy from April 1, 1952, for three years.

In Congregation on March 8 the following degrees were conferred:

M.D.—*J. G. Selwyn, *J. P. Henry, S. C. Gold, A. S. Mason, C. F. Barwell.

M.B., B.CHIR.—*T. H. Morgan, J. H. F. Batstone.

*By proxy.

UNIVERSITY OF LONDON

The following candidates have been approved at the examinations indicated:

ACADEMIC POSTGRADUATE CERTIFICATE IN TROPICAL MEDICINE AND HYGIENE.—*London School of Hygiene and Tropical Medicine:* P. A. Cooper, E. B. Harvey, J. Newsome.

ACADEMIC POSTGRADUATE DIPLOMA IN MEDICAL RADIOLOGY (DIAGNOSIS).—*Part I:* D. A. B. Ashcroft, A. Berezowski, M. E. Berk, A. S. Bligh, D. Brink, N. L. Bucky, H. Fateh, B. C. Hale, M. A. Harris, K. N. Kamdar, J. K. Lundie, G. A. Medhurst, J. L. Morris, D. MacK. K. Muir, I. A. H. Munro, E. Price, L. J. Sandell, J. V. Tillet, L. E. Wolpert, M. Ziman, I. Yentis.

Dr. W. D. M. Paton has been appointed to the University Readership in Pharmacology and Therapeutics tenable at University College and University College Hospital Medical School.

UNIVERSITY OF BIRMINGHAM

At the annual meeting of the Court of Governors held on February 21 Dr. H. Thwaite was appointed a Life Member of the Court, and the title of Emeritus Professor was conferred upon Dame Hilda Lloyd, formerly professor of obstetrics and gynaecology in the University.

Professor T. L. Hardy has been invited by the Council to continue to hold his University appointment as part-time Professor of Gastroenterology for a period not exceeding three years after he has ceased to hold his hospital appointment next month.

Dr. David Mendel has been appointed National Coal Board Research Fellow in the Department of Medicine from January 1.

The University is founding an additional special lectureship in the Faculty of Medicine to be known as "The Leonard Parsons Memorial Lectureship."

A bronze head of Dame Hilda Lloyd has been completed by Mr. Jacob Epstein, R.A., and a presentation ceremony is being arranged.

INFECTIOUS DISEASES AND VITAL STATISTICS

Summary for British Isles for week ending March 8 (No. 10) and corresponding week 1951.

Figures of cases are for the countries shown and London administrative county. Figures of deaths and births are for the 160 great towns in England and Wales (London included), London administrative county, the 17 principal towns in Scotland, the 10 principal towns in Northern Ireland, and the 14 principal towns in Eire.

A blank space denotes disease not notifiable or no return available. The table is based on information supplied by the Registrars-General of England and Wales, Scotland, N. Ireland, and Eire, the Ministry of Health and Local Government of N. Ireland, and the Department of Health of Eire.

* Measles not notifiable in Scotland, whence returns are approximate.

† Includes primary and influenzal pneumonia.

‡ Includes puerperal pyrexia.

Vital Statistics

Influenza in Glasgow

We are indebted to Dr. Stuart Laidlaw, medical officer of health for Glasgow, for the following report: Influenza due to virus A was present in Glasgow in January, 1951. During the course of the present winter another outbreak of influenza occurred in the community. The prevalence of the present outbreak is best shown by the increase in the figures of the Ministry of National Insurance "first certificates," which rose from 2,991 for the week ending January 1, 1952, to a maximum of 9,772 for the week ending March 4. Even allowing for a seasonal rise to some 4,000, it is known that more than 50% of the excess over the normal figures has been accounted for by influenza. A similar trend is shown in the notifications of primary pneumonia, which rose from 99 in the first week of January to 300 in the week ending March 8, and in influenzal pneumonia, which was practically absent in January but increased to 36 in the third week of February. School attendances were also affected by the outbreak and showed the progression of the illness through the city, beginning in the south side and spreading to the north, the difference in time of incidence being approximately three weeks. In some schools absenteeism approached the 25% level, and 15-20% was very frequently recorded. No true record can be obtained of the number of individuals who have been infected, but from the information available to the Department it has been estimated that between 70,000 and 100,000 persons in the city have been affected. This gives a morbidity rate of roughly 10%. All age groups have been involved, although children over the age of 5 years and adults predominate.

Symptomatology.—The illness was of three to four days' duration, the symptoms being running nose and eyes, feverishness, headache, sore throat, laryngitis, pains in the limbs, and frequently epistaxis. Temperatures at the onset of the illness were between 100° F. (37.8° C.) and 103° F. (39.4° C.), and the pulse rate was correspondingly increased. The large majority of cases resolved without complication, but influenzal pneumonia has to some extent complicated the picture. Relapses have occurred in a number of cases about a week to 10 days after the initial illness, and have taken the form of a bronchitic cough and occasional gastric upset. The cases admitted to hospital responded well to treatment, and deaths in hospital were few.

Severity.—The epidemic, although widespread, had a low mortality rate. Deaths from respiratory diseases have risen from 21 to 94 per week compared with 155 deaths during the second week of January, 1951, when the virus-A outbreak was at its peak. The death rate for the city has not risen above 20 per 1,000 in any week as contrasted with the maximum of 28.6 per 1,000 during the worst week of the 1951 outbreak.

Virology.—Serological tests on specimens from a variety of sources examined at the Brownlee Virus Laboratory, Ruchill Hospital, Glasgow, have indicated that the causative virus is of the influenza-B strain. The causative virus itself has been isolated at the Colindale Laboratory, London. Several patients who were admitted to hospital during the second week of February suffering from influenzal pneumonia showed titres indicative of infection some 10 days previously, and from these tests it is obvious that the virus was present in the community during the first week of February. Although the outbreak is not yet over, the indications are that the disease is definitely on the wane.

Smallpox in Lancashire

During the week ending March 22, 16 cases of variola minor were notified. All are associated with the focus in Rochdale C.B. There have been no deaths, and there is no report of the disease elsewhere. Up till March 22, 110 cases had been notified.

Infectious Diseases

Infectious diseases were more prevalent in England and Wales during the week ending March 8, and increases in the number of notifications were recorded for measles 650, whooping-cough 129, scarlet fever 75, and acute pneumonia 82.

The rise in the incidence of measles was mainly contributed by three counties—Lancashire 201, Cheshire 139, and Yorkshire West Riding 132. The largest fall in the number of notifications of measles was 61 in Middlesex. The rise in the incidence of whooping-cough was mainly contributed by Wales, where the number of notifications increased by 89 (Anglesey 27 and Monmouthshire 26). The local trends of scarlet fever showed only small variations from the preceding week. The number of notifications of diphtheria were 5 more than in the previous week, but no change of any size occurred in the local returns.

For the first time in recent years no case of typhoid fever was notified in the country.

Notifications of acute poliomyelitis were 2 fewer for paralytic cases and 2 more for non-paralytic than in the preceding week. The only counties with more than one case were Warwickshire 4 (Birmingham C.B. 3) and Yorkshire West Riding 4.

In Lancashire 62 cases of smallpox were notified; these were reported from Rochdale C.B. 59, Heywood M.B. 1, Littleborough U.D. 1, Milnrow U.D. 1.

The notifications of dysentery were 8 fewer than in the preceding week. The largest returns were Lancashire 135 (Oldham C.B. 46); London 62 (scattered over 16 boroughs); Norfolk 63 (Norwich C.B. 49); Middlesex 45 (Enfield U.D. 14, Hayes and Harlington U.D. 10); Southampton County 43 (New Forest R.D. 30); Yorkshire West Riding 33 (Bradford C.B. 12); Dorset 27 (Dorchester M.B. 25); Surrey 21 (Esher U.D. 12); Warwickshire 21 (Coventry C.B. 11).

Graphs of Infectious Diseases

The graphs below show the uncorrected numbers of cases of certain diseases notified weekly in England and Wales. Highest and lowest figures reported during the nine years 1943-51 are shown thus -----, the figures for 1952 thus ————. Except for the curves showing notifications in 1952, the graphs were prepared at the Department of Medical Statistics and Epidemiology, London School of Hygiene and Tropical Medicine.

**Road Accidents in January**

Accidents on the roads of Great Britain in January resulted in 14,195 casualties, including 377 killed and 3,347 seriously injured. Compared with January, 1951, there was an increase of 678 in the total and of 13 in the killed. The chief increases were in the figures for pedal cyclists, which rose by 199 to 2,709, and those for passengers in vehicles, which rose by 255 to 3,543. Despite the continued upward trend, the accident figures for January were still considerably below those for January, 1938, when 15,745 casualties, including 514 killed, were reported.

Week Ending March 15

The notifications of infectious diseases in England and Wales during the week included: scarlet fever 1,546, whooping-cough 3,086, diphtheria 53, measles 7,121, acute pneumonia 950, acute poliomyelitis 22, dysentery 642, paratyphoid fever 7, and typhoid fever 4.

That trachoma is curable and should be considered a disease which in general is only mildly contagious, except to young children, are the main conclusions of the W.H.O. Expert Committee on Trachoma which met in Geneva for its first session March 3 to 8, under the chairmanship of Professor Giambattista Bietti, of Parma, Italy. A treatment combining sulphonamides and certain antibiotics is said to be completely effective against most cases of trachoma. "Aureomycin" and terramycin are considered to be the drugs of choice. Trachoma control measures should include all the allied eye infections as well as epidemic conjunctivitis, the committee said, and it recommended a model control programme for this entire group of diseases which can be applied in underdeveloped countries. The plan calls for special legislation for health education of the people, and for a special organization, including fixed and mobile clinics attached to a trachoma institute. The important part that can be played by school-teachers in case-finding and treatment was emphasized.

Medical News

Devon and Exeter Medico-chirurgical Society.—At a meeting on January 24 Mr. Raymond Hinde spoke on "Tonsils and Adenoids: Dogmas and Doubts." The physiology of the tonsils and adenoids, he said, is imperfectly understood. The pharyngeal lymphoid tissue is functional only from birth to puberty, after which time the adenoids disappear. There is a close morphological relationship between the lymphoid tissue of Waldeyer's ring and that of Peyer's patches; indeed, when the tonsils are swollen the Peyer's patches also enlarge. Tonsillar changes occur at the time of the first dentition at the age of 2½ years, and enlargement at that time may be due to local sepsis in the mouth. But far oftener it is in the nature of a hyperplasia, the sequel of a physiological rather than a pathological change, and it is not possible to tell whether a tonsil is septic or not merely by looking at it. A swab from the tonsils is never sterile. Only when a crypt becomes sealed off does it become a source of sepsis. However, the tonsils are a portal of entry for the tubercle bacillus, and some 4% of all tonsils removed show giant-cell systems. In diagnosis it is important to remember that mouth-breathing may be due to factors other than nasal obstruction by adenoids, and not every child who keeps his mouth open breathes through it.

North of England Obstetrical and Gynaecological Society.—A meeting of the society was held in the Medical Institution, Liverpool, on February 22, when Dr. F. Da Cunha described a case of massive haemorrhage following anticoagulant therapy in pregnancy, Dr. Joseph Firth described a case of severe post-partum haemorrhage finally treated by hysterectomy, and Mr. S. B. Herd reported a case of apparent sarcoma of the ovary. Mr. L. W. Cox gave a short paper on intestinal diverticulitis and the gynaecologist, and Dr. S. J. Barr read a short paper on pressure effects of fibroids in pregnancy.

Brazilian Congress of Proctology.—The first Brazilian proctological congress was held from November 14 to 17, 1951, in Rio de Janeiro, a great many specialists from several American countries taking part. The congress was promoted and organized by Dr. Walter Gentile de Mello, president of the Brazilian Proctological Society. The *Annals* of the congress will be published in two volumes, already in preparation, with a summary of each lecture and paper in English. The editors are Drs. W. Gentile de Mello and Manoel Garcia, Avenida Graça Aranha, 81, Rio de Janeiro, Brazil.

Emergency Bed Service: Applications and Admissions.—During the seven days ending March 24 the number of applications made by doctors to the London Emergency Bed Service for admission of patients was 1,100, of whom 89.75% were admitted.

COMING EVENTS

Wessex Rahere Club Dinner.—The spring dinner will take place at the Royal Clarence Hotel, Exeter, on Saturday, April 19. Mr. C. Naunton Morgan will be the guest of honour. Further details will be circulated to members and any other Bart's men practising in the West Country who will get in touch with the Hon. secretary, Mr. A. Daunt Bateman, 3, The Circus, Bath.

Osler Club.—The next meeting of the club will take place on Friday, April 18, at the Wellcome Research Institution, Euston Road, London, N.W.1 at 7.45 p.m. The evening will be devoted to Leonardo da Vinci (whose quincentenary falls on April 15), and the opening paper, by Dr. K. D. Keele, will be on "Leonardo the Physiologist."

Medical Art Society.—The annual exhibition of members' work will be held at Walker's Galleries, New Bond Street, W.1, from April 21 to May 3. Receiving day Monday, April 7. The annual dinner will be held on April 21.

Health and Tuberculosis Conference.—The conference will be held in London from July 8 to 13 and is open to all interested in preventive medicine. Subjects for discussion include protective vaccination, contemporary ideas in the management of the tuberculous patient; the social worker and the tuberculous family, the patient in industry, and tuberculosis in British Colonial territories. All information can be obtained from N.A.P.T., Tavistock House North, Tavistock Square, London, W.C.1.

Courses on Mental Defectives.—The Extra-mural Department of the University of London, in co-operation with the National Association for Mental Health, is organizing a course for medical officers on educationally subnormal children and mental defectives which will be held May 5 to 23 and repeated October 6 to 24 at the University Examination Hall, South Kensington. Full details and application forms may be obtained from the National Association for Mental Health, 39, Queen Anne Street, W.1. The total cost is £15.

International College of Surgeons.—The following meetings are announced: The French Chapter, University of Bordeaux, May 13 and 14. The Spanish Chapter (Catalonian Section), University of Barcelona, May 16, 17, and 18. International Assembly, University of Madrid, May 20 to 23. The Austrian Chapter, Vienna, May 26 and 27. The Dutch Chapter, Amsterdam, May 29 and 30. Fellows desirous of information or wishing to attend any of these meetings should make early application to the secretary of the British Chapter, Dr. J. F. Brailsford, 20, Highfield Road, Edgbaston, Birmingham, 15.

SOCIETIES AND LECTURES

A fee is charged or a ticket is required for attending lectures marked Ⓢ. Application should be made first to the institution concerned.

Tuesday, April 1

ROYAL COLLEGE OF PHYSICIANS OF LONDON, Pall Mall East, S.W.—5 p.m., "Structural and Functional Adaptation in Renal Failure," Lumsden Lecture by Professor Robert Platt. (See also April 3.)

ROYAL EYE HOSPITAL, St. George's Circus, Southwark, London, S.E.—5 p.m., "Cataract Extraction," by Mr. T. M. Tyrrell.

Wednesday, April 2

BIRMINGHAM MEDICAL INSTITUTE: MIDLAND MEDICAL SOCIETY.—At Queen Elizabeth Hospital, Birmingham, clinical meeting.

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, London, W.C.—5 p.m., "Peripheral Aneurysm and Arteriovenous Fistula," Hunterian Lecture by Professor S. M. Cohen.

ROYAL EYE HOSPITAL, St. George's Circus, Southwark, London, S.E.—5.30 p.m., "Visual Fields," by Mr. Howard Reed.

ROYAL INSTITUTE OF PUBLIC HEALTH AND HYGIENE, 28, Portland Place, London, W.—3.30 p.m., "Disturbances of Sleep in Children," by Professor R. S. Illingworth.

YORKSHIRE SOCIETY OF ANAESTHETISTS.—At Leeds General Infirmary, 8 p.m., "Theoretical and Practical Aspects of Therapeutic Nerve Blocking," by Dr. G. Steel.

Thursday, April 3

BIRMINGHAM MEDICAL INSTITUTE: SECTION OF ODONTOLOGY.—At 154, Great Charles Street, Birmingham, joint meeting with British Dental Association, Central Counties Branch. "Oral Cancer, with Special Reference to Radiotherapy," by Mr. W. H. Bond. Annual general meeting will follow.

FACULTY OF HOMOEOPATHY.—At Royal London Homoeopathic Hospital, Great Ormond Street, London, W.C., 5 p.m., "Homoeopathy and the Hypothalamus," address by Dr. T. F. Stewart.

OXFORD UNIVERSITY.—At Radcliffe University, Oxford, 5 p.m., "The Significance and Mechanism of Menstruation," Litchfield Lecture by Dr. T. N. MacGregor.

ROYAL ARMY MEDICAL COLLEGE.—At Lecture Theatre, John Islip Street, London, S.W., 5 p.m., "The Treatment of Hypertension," by Professor M. Leonard Rosenheim.

ROYAL COLLEGE OF PHYSICIANS OF LONDON, Pall Mall East, S.W.—5 p.m., "Structural and Functional Adaptation in Renal Failure," Lumsden Lecture by Professor Robert Platt. (See also April 1.)

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, London, W.C.—5.30 p.m., "Intracranial Thrombophlebitis," Otolaryngology Lecture by Sir Charles Symonds.

ROYAL EYE HOSPITAL, St. George's Circus, Southwark, London, S.E.—5.30 p.m., "Detachment of the Retina," by Miss M. Savory.

Friday, April 4

EUGENICS SOCIETY.—At 26, Portland Place, London, W., 5 p.m., "The Genetics of Mental Deficiency," Galton Lecture by Dr. J. A. Fraser Roberts.

●INSTITUTE OF DISEASES OF THE CHEST AND INSTITUTE OF CARDIOLOGY.—At London School of Hygiene and Tropical Medicine, Keppel Street, W.C., 5.30 p.m., "Cardiac Trauma," by Mr. Norman Barrett.

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, London, W.C.—5 p.m., "After Fifty-six Years," Lister Oration by Sir James Learmonth.

SOCIETY OF ANAESTHETISTS OF SOUTH WALES.—At Cardiff Royal Infirmary, 7.30 p.m., films on anaesthetics.

WHIPPS CROSS HOSPITAL MEDICAL SCHOOL SOCIETY, Whipps Cross Hospital, London, E.—8.30 p.m., "Diarrhoeas of Bacterial Origin," by Dr. Joan Taylor.

APPOINTMENTS

CONNOLLY, EUGENE V., M.B., B.Ch., D.P.H., D.C.H., County Medical Officer of Health, Longford, Eire.

DEWAR, R. DUNCAN, M.B., B.Ch., D.P.H., Medical Officer of Health for the Metropolitan Boroughs of Bethnal Green and Poplar.

GRAY, H. M.D., D.P.H., Assistant County Medical Officer and Medical Officer of Health, Bulmer Combined Area, Yorkshire.

HAGGER, A. O., M.R.C.S., L.R.C.P., Assistant Medical Officer, Eastern Region, British Railways.

NORTH-EAST METROPOLITAN REGIONAL HOSPITAL BOARD.—Part-time Consultant Anaesthetist, Queen Elizabeth Hospital for Children, Mrs. Dorothea B. I. Halstead, M.B., B.Ch., D.A., D.C.H. Full-time Consultant Pathologist, Group Laboratory, Mile End Hospital, W. D. Linsell, M.D. Part-time Consultant Physician, St. Andrew's Hospital, Billericay, I. Gilbert, M.D., M.R.C.P. Part-time Consultant Physician, St. George-in-the-East Hospital, A. S. Mason, M.B., B.Ch., M.R.C.P. Part-time Consultant E.N.T. Surgeon, East Ham Memorial and Runwell Mental Hospitals, N. A. Punt, F.R.C.S.Ed., D.L.O. Part-time Consultant Surgeon, St. Andrew's Hospital, Bow, G. A. Barclay, M.B., B. Chir., F.R.C.S. Full-time Consultant Surgeon, Colchester Group of Hospitals, R. N. Jones, M.Chir., F.R.C.S. Maximum Part-time Consultant Surgeon, North Middlesex Hospital and Annexes, K. A. Moore, M.B., B.S., F.R.C.S. Part-time Consultant Surgeon, Prince of Wales's and St. Ann's Hospitals, E. E. O'Malley, M.Ch., F.R.C.S.

BIRTHS, MARRIAGES, AND DEATHS

BIRTHS

Clayton.—On March 17, 1952, at the Garrett Anderson Maternity Home, London N.W., to Barbara E. Clayton, Ph.D., M.B., B.Ch., wife of William Klyne, a son.

Manson.—On February 25, 1952, at Salisbury, Southern Rhodesia, to Jocé, wife of Dr. John M. S. Manson, of Kanye, Bechuanaland Protectorate, a daughter.

Morel.—On March 22, 1952, at Barnstaple, Devon, to the wife of Mervyn Morel, M.B., F.R.C.S., a daughter.

Muir.—On February 25, 1952, in London, to the wife of Ian Muir, M.B.E., F.R.C.S., a son.

Naidoo.—On February 18, 1952, in London, to Sandhya Bose, M.A., wife of Dr. D. Naidoo, a son—Satyadatta.

Powell-Tuck.—On March 20, 1952, at Netherwood, Solihull, to Catherine, wife of Dr. G. A. Powell-Tuck, 7, Milverton Road, Knowle, Warwicks, a brother for Jeremy.

MARRIAGES

Jenkins—Evans.—On March 18, 1952, at Gilfach Goch, Glam., Ritchie T. Jenkins, M.B., B.Ch., M.R.C.P., to Eileen Joyce Evans, M.B., B.Ch.

DEATHS

Berkeley.—On March 17, 1952, Augustus Frederic Millard Berkeley, L.R.C.P.&S.Ed., L.R.F.P.S., of 183, Kennington Road, London, S.E., aged 83.

Black.—On March 15, 1952, at 4, Anglesey Road, Alverstoke, Hants, Francis George Hamilton Rollic Black, M.B., B.Ch., Surgeon Captain, R.N., retired, aged 69.

Bramwell.—On March 21, 1952, at 29, Ormidale Terrace, Edinburgh, Edwin Bramwell M.D., Hon. LL.D., F.R.C.P., F.R.C.P.Ed., aged 79.

Consul.—On December 26, 1951, Bishambar Dayal Consul, L.M.S.S.A., of "Vidya," Colchester Road, Harold Park, Romford, Essex.

Costello.—On March 17, 1952, at "Clare," Huiham Road, Exmouth, Devon, James Joseph Costello, L.R.C.P.&S.I. & L.M.

Coullie.—On March 17, 1952, at Dimblecroft, Alton, Staffs, Alexander Glover Coullie, M.D., F.R.C.S.Ed., Lieutenant-Colonel, I.M.S., retired.

Crosfield.—On March 20, 1952, at Old Tolmers, Broadstairs, Kent, Arthur Mellor Crosfield, L.R.C.P.&S.Ed., L.R.F.P.S., formerly of Belgrave, Leicester, aged 79.

Ellis.—On March 18, 1952, at Gorleston Hospital, Edward Alfred Ellis, M.B., B.Ch., of 147 Lawn Avenue, Great Yarmouth, aged 49.

Ellison.—On March 19, 1952, at the Royal Northern Hospital, Philip Oswald Ellison M.B., B.S., of Buckhurst, Gerrards Cross, Bucks.

Ferguson.—On March 20, 1952, at his home, 29, Coudray Road, Southport, Lancs, James Ferguson, L.R.C.P.&S.Ed., L.R.F.P.S.

McElligott.—On March 19, 1952, Maurice Gerald McElligott, F.R.C.S.I., D.P.H., of Mount Rivers, Listowel, Co. Kerry, late of Bushey Heath, Herts, aged 83.

Reid.—On March 14, 1952, Henry Charles Cecil Reid, M.B., B.Ch., of "Elstow," Hartley Park Villas, Plymouth.

Tacey.—On March 22, 1952, at Woodford, London, E., Dalton William Tacey, M.R.C.S., L.R.C.P., aged 76.

Talbot.—On March 20, 1952, at Prospect House, Mottram, near Manchester, Ernest Talbot, M.C. M.B., B.Ch.

Any Questions?

Correspondents should give their names and addresses (not for publication) and include all relevant details in their questions, which should be typed. We publish here a selection of those questions and answers which seem to be of general interest.

Aetiology of Coronary Disease

Q.—What aetiological relationship, if any, has mild but prolonged hyperpiesia to coronary artery disease?

A.—The exact aetiology of coronary artery disease, meaning obliterative coronary sclerosis, is unknown. A number of factors, some of which are perhaps no more than contributory, are well recognized. For instance, there are hereditary aspects, coronary disease at certain ages being twice as common amongst the parents of those stricken with a coronary thrombosis than amongst controls. Similarly, coronary disease is common in those of "stocky build." There is evidence to suggest that a certain psychological background—the successful "go-better" type—prepares the way for coronary mischief. It is also claimed, probably with more justification, that arteriosclerosis is a biochemical disorder involving cholesterol, phospholipids, and uric acid. Hypertension may have a similar background. At all events hypertension is found in approximately 50% of men and 75% of women handicapped by angina pectoris, which is the commonest manifestation of coronary disease. On the other hand, hypertension is unusual amongst males stricken with myocardial infarction before the age of 40 years. It therefore appears that hyperpiesia is not an essential factor in the production of coronary sclerosis. It is, however, a very common associate. Even mild but long-continued hypertension must impose a strain on the arteries and aggravate, if it does not indeed predispose to, intimal vascular damage. It is usually true that to the individual the sclerosis, which is not necessarily an irreversible process, is more harmful than the hypertension.

Diet in Toxaemia of Pregnancy

Q.—What dietetic treatment is advised nowadays in toxaemia of pregnancy?

A.—Of recent years the importance of diet restriction has been emphasized not only in the treatment but also in the prevention of pregnancy toxaemia. By controlling the weight of a woman during pregnancy the incidence of toxaemia can be reduced. It is the sudden and rapid increase of weight that is the danger sign. Some obstetricians view an increase of more than $\frac{1}{2}$ lb. (227 g.) a week as abnormal and try to limit the total gain throughout pregnancy to 20 lb. (9.08 kg.). The abnormal weight gain in many pregnant women is due to perversion of appetite and the excessive ingestion of food of high caloric value (carbohydrate and fat). When there has been a too rapid increase in weight the mother should be carefully questioned about her diet. She should be told not to use salt in cooking or at table, not to take bicarbonate of soda as a medicine, and not to take any "salts."

The following diet* can be taken as an out-patient, and has a caloric value of 1,800: $1\frac{1}{2}$ pints of skimmed milk daily. *Breakfast*: tea or coffee with milk, no sugar; $2\frac{1}{2}$ oz. salt-free bread; $\frac{1}{2}$ oz. salt-free margarine; 1 egg; 4 oz. orange or fruit juice. *Mid-morning*: tea or coffee with milk, no sugar. *Lunch*: 3 oz. lean beef, 6 oz. potato, 6 oz. green vegetable, $\frac{1}{2}$ oz. rice with milk, 4 oz. fruit. *Tea*: tea with milk (no sugar), 2 oz. salt-free bread, $\frac{1}{2}$ oz. salt-free butter, 4 oz. fruit. *Supper*: 4 oz. white fish, 5 oz. root vegetables, salad (2 oz. lettuce, 3 oz. tomato, 1 oz. water-cress), $2\frac{1}{2}$ oz. salt-free bread, $\frac{1}{2}$ oz. salt-free butter, 4 oz. fruit. *Bed-time*: any milk left from $1\frac{1}{2}$ pints. Alterna-

*One ounce avoirdupois=28.4 g. One fluid ounce=28.4 ml.

tives for lean beef are: lean mutton, lean veal, liver, heart, rabbit, chicken, rationed cheese (cheddar type). Calcium, iron, and vitamin supplements (A, B complex, C, D) are necessary. The actual vitamin content of fruits and vegetables is always doubtful. Food yeast, which is a good source of vitamin-B group, can be used to improve the flavour of the skimmed milk.

Once pregnancy toxæmia has established itself the following 1,200-calorie diet should be advised: 1 pint skimmed milk daily. *Breakfast*: tea or coffee with milk (no sugar), 1½ oz. salt-free bread, ¼ oz. salt-free butter, 1 egg, 4 oz. fruit or tomato. *Mid-morning*: tea or coffee with milk (no sugar). *Lunch*: 2 oz. lean beef or equivalent (see 1,800-calorie diet above), 6 oz. green vegetable, 5 oz. root vegetable, ¼ oz. margarine for vegetables, 4 oz. fruit. *Tea*: tea with milk (no sugar), 1 oz. salt-free bread, ¼ oz. salt-free butter, salad if desired. *Supper*: 4 oz. white fish, salad (2 oz. lettuce, 3 oz. tomato, 1 oz. watercress), 1½ oz. salt-free bread, ¼ oz. salt-free margarine, 4 oz. fruit. *Bedtime*: any milk left from 1 pint. Protein, mineral, and vitamin values cannot be increased without increasing calorie value, except by the use of concentrates and supplements. Skimmed milk is recommended as a means of maintaining protein and calcium levels in this calorie intake. A protein supplement, such as a casein preparation, can be added to the milk. The usual vitamin supplements will be required, and food yeast, which can be given to improve the flavour of the skimmed milk, is a good source of vitamins of the B group. Calcium and iron supplements are necessary. With a diet restricted to this degree it is advisable for the patient to be in bed. After a week, depending on the patient's condition—weight loss, blood pressure, albuminuria—it might be possible to increase the calorie intake to 1,500 calories.

R. H. J. Hamlin has recently reported that in a large maternity hospital in Sydney eclampsia has been eliminated and pre-eclampsia reduced to a minimum by the adoption of two simple measures: (1) The giving of correct diet education in the early weeks of pregnancy (low-carbohydrate, high-protein, high-vitamin diet before mid-pregnancy). (2) Restricting the mother's increase in weight to 8 lb. between the 20th and 30th weeks of pregnancy.

Bat Ears

Q.—What is the optimum age for operating on a protruding ear? The patient in question is a child aged 20 months with marked protrusion of both ears.

A.—Operative correction of protruding ears is best delayed until the child is at least 4 years old. In cases of marked protrusion it is desirable to perform the operation before the patient starts school. With mild deformities the operation is best left until the age of 9 or 10 years. In early childhood there is disproportion between the size of the ear and the size of the head, and mild degrees of protrusion may become less obvious as the child grows.

Heliotherapy

Q.—What are the therapeutic uses of sunshine? Can different effects be obtained from it, especially in the Tropics or subtropics, by exposure at different times of the day?

A.—The solar spectrum includes ultra-violet and infra-red rays which are used therapeutically. The ultra-violet rays will cause pigmentation, but the actual medical value of these rays is not very great. The infra-red rays (or heat rays) are widely used in therapy. Strong sunshine can therefore be used as a substitute for an infra-red lamp. The only difference that the time of day would cause in treatment is that the amount of rays would decrease as the sun drops towards the horizon. Attempts have been made to set up solaria in places such as the South of France for the therapeutic use of the sun spectrum, but in actual practice it is usually more certain and convenient to use artificial methods of producing these rays rather than to depend on the vagaries of the weather.

Storage of Drinking-water

Q.—How may water in storage tanks be kept fresh for drinking? I wish to store water in a 10-gallon (45.5-litre) galvanized container for periods up to a fortnight.

A.—The tank should be provided with a lid which excludes light and dust. It should be cleansed and then sterilized as follows: Half-fill with tap water; add 3 oz. (85 ml.) of a 1% solution of chlorine; completely fill with water; see that the under-surface of the lid is also cleansed with chlorine solution and do not allow it subsequently to become contaminated; replace lid; allow to stand for 24 hours; empty tank. (This need not be repeated each time the tank is filled unless there is good reason for doing so.) The tank may then be filled with tap water, after making sure that any hose used for this purpose is clean. The lid should then be carefully replaced to exclude light and dust. Should there be any doubt about the purity of the water a teaspoonful of 1% chlorine solution may be added while filling the tank. The tank should be situated in as cool a place as possible. Water stored in this manner should keep sweet and pure for at least one month.

The Doctor at the Sink

Q.—In reply to a question on cleaning empty medicine bottles (August 11, 1951, p. 371) liquor sulphestolis B.P.C. was recommended. Would this substance be equally useful for domestic dish-washing?

A.—Liquor sulphestolis B.P.C. is quite satisfactory for the washing of kitchen utensils, being particularly effective in removing grease. It also gives a good polish to glassware. If the vessels are thoroughly rinsed afterwards there is unlikely to be any noticeable smell and practically no danger of toxicity. Liquor sulphestolis is available commercially under various trade names.

NOTES AND COMMENTS

Pregnancy Tests.—Dr. H. BERIC WRIGHT (London) writes: It does not seem to be generally realized that the Hogben test is at least as reliable as the better-known Aschheim-Zondek and Friedman tests ("Any Questions?" March 1, p. 501). This is a pity, because this method has advantages both for the practitioner and for the pathologist. Landgrebe and Hobson (*British Medical Journal*, 1949, 2, 17) showed that the Hogben test is, if anything, more accurate than the Aschheim-Zondek. It has the advantage—to the practitioner—of giving a result within 24 hours of receipt of the specimen. Thus a laboratory using this method can give a more rapid service than one using the Aschheim-Zondek or Friedman technique. The test usually becomes positive within 10 to 14 days of the first missed period. From the point of view of laboratory technique the animals used for the Hogben test are easier and cheaper to keep and can be used repeatedly. The Hogben test is thus to be preferred by both the practitioner and the pathologist and deserves to be more widely recognized than it is at present.

OUR EXPERT writes: It is true that the pregnancy diagnosis test using the female toad *Xenopus laevis* has certain advantages over the Aschheim-Zondek and Friedman tests; still further advantages are possessed by the Galli Mainini test using male amphibia such as *Bufo arenarum* Hensel, *Rana pipiens*, and *Rana esculenta*, for in these tests the result is obtained in less than three hours.

Correction.—In a reply to a question on hair oil ("Any Questions?" March 15, p. 614) reference was made to R. C. Harry's book *Modern Cosmetology*. This is published by Leonard Hill Ltd., not by Chapman and Hall as stated.

THE ADJUDICATOR'S AWARD

£40M. TO BE PAID, MINISTER OF HEALTH

100 PER CENT. BETTERMENT FOR 1951

85 PER CENT. BETTERMENT FOR 1948

The Adjudicator, Mr. Justice Danckwerts, has made the following decisions on the adjudication between the General Medical Services Committee of the British Medical Association (representing the general practitioners in the National Health Service) and the Minister of Health and the Secretary of State for Scotland :

My Terms of Reference are as follows:

"To determine the size of the central pool, after taking account of remuneration from all other sources received by general practitioners, in order to give effect to the recommendations of the Spens Committee, having regard to the change in the value of money since 1939, to the increases which have taken place in incomes in other professions, and to all other relevant factors."

My determination is that the size of the central pool for the year ending on March 31, 1951, should be £51.252m. As was agreed at the hearing, an adjustment to this figure will have to be made in respect of Exchequer superannuation contribution. In order that this determination may be applied to other years I add the following explanations:

(1) I have applied a betterment factor of 100% to the figure of £19.89m. for 1939. In my view the corresponding factor in 1948 would be 85%.

(2) The figure which I have reached has been adjusted by reference to the number of doctors in

the National Health Service and not the population. There was no evidence before me that an unnecessarily large number of doctors is likely to enter the Service within the next few years, but if the number of doctors in the Service became unreasonably large this point would require re-consideration.

(3) I have excluded interest on compensation moneys from consideration.

(4) I have excluded from the credits which had to be deducted in determining the size of the central pool the amount of the inducement fund in respect of unattractive areas.

(5) I have taken a percentage of 38.7% for expenses. But I have not accepted entirely the figures to which this percentage should be applied.

(signed) HAROLD DANCKWERTS.

March 24, 1952.

(See Leading Article in Journal at page 697)

THE ADJUDICATION

PRESENTATION OF DOCTORS' CASE

The adjudication proceedings opened on March 18 before Mr. Justice DANCKWERTS in Chancery Court III. The General Medical Services Committee of the British Medical Association was represented by Mr. Frederick Grant, Q.C., Mr. H. B. H. Hylton-Foster, Q.C., M.P., and Mr. S. B. R. Cooke. The Minister of Health and Secretary of State for Scotland were represented by the Attorney-General (Sir Lionel Heald, Q.C., M.P.), Mr. Granville Slack, and Mr. Peard Clarke.

FIRST DAY

Tuesday, March 18

120% Betterment Claimed

The opening observations of Mr. GRANT, Q.C., in presenting the case for the Committee were briefly reported in the last issue. Continuing, he put in a statement of agreed figures worked out by Professor Bradford Hill on the basis of 1939 values:

Gross professional receipts of persons in general practice as principals before the war, £28.14m., of which £11.35m. was absorbed by professional expenses, leaving £16.79m. net professional income. If recommendations (1) and (2) of the Spens Committee had been applied to these principals, the total net professional remuneration per annum would have been greater by £3.1m.—that is, it would have been £19.89m.

The basis of this calculation was that there were 17,900 general practitioners in practice as principals before the war.

Mr. Grant also put in the following statement (not agreed):

The basis on which payments to the central pool have so far been made is as follows: Net income £19.89m. + 20% = £23.87m.; expenses, £11.35m. + 55% = £17.59m., totalling £41.46m. To this add 3% for increase in population = £1.24m., making £42.70m., and deduct 5% for people not using N.H.S., £2.13m., leaving £40.57m.

This sum of £40.57m. represents approximately 18s. per head on 95% of population round about the year 1948. The amount actually paid in the central pool for the year ended March 31, 1951, was 18s. per head of 95% of population for that year—namely, £41.533m.

He gathered that it was not suggested that this basis of calculation was a scientific one, though it was clear from the Minister's case that he still relied on the 3% increase of population and the 5% non-users of the Service, which were assumptions.

What Ought to be in the Central Pool

He next put in some figures showing what, according to the Committee's calculations, ought to be in the central pool for the year ending March 31, 1951:

	£
Adjusted net income of general practitioners for 1939	19.89m.
Betterment addition (120%)	23.868m.
	43.758m.

That figure was scaled up again by reference to the number of general practitioners serving as principals in the National Health Service in the year ended March 31, 1951—namely, 19,227—and after allowing for practice expenses and making certain adjustments, of which he spoke in more detail at a later stage, he arrived at a total for the central pool on March 31, 1951, of £57.378m., whereas in fact the amount actually paid was £41.533m.

The Betterment Factor

Dealing with the addition of 120% for betterment, Mr. Grant said that they were entitled, in order to give proper effect to the recommendations of the Spens Committee, to scale up the £19.89m., which was the adjusted net income of general practitioners for 1939, by a percentage which covered both the change in the value of money and the increase in remuneration of members of other professions. Their evidence on this point was set out in a memorandum by Professor R. G. D. Allen, who would be called as a witness. The Ministry had produced voluminous figures on this subject without saying exactly how they were to be used, but he thought he could see quite a number of grounds on which they were open to criticism. He would, however, withhold such criticism until the figures had been formally presented.

The Ministry had said that it was a matter for consideration whether the betterment percentage ought to be added to the actual figure of the net remuneration in 1939 or to the adjusted figure. But surely it was evident that the percentage for betterment ought to be added to what the figure should have been in 1939, and not to the wholly irrelevant figure of what it actually was in that year.

They had treated as exceptions, not to be brought into the general calculation, those general practitioners who had restricted lists. There was a dispute, he gathered, about scaling up. The Ministry said that what ought to be done was to scale up first by reference to increase in population, and then to scale down by reference to the population estimated not to be making use of the National Health Service. That, however, was not giving effect to the Spens recommendations. It proceeded on the assumption that what the Spens Committee had said was that £19.89m. was the amount needed to pay properly for general-practitioner doctoring in the country in 1939, and therefore that that amount could be altered only by reference to changes in the number of people requiring to be doctored. But that was not what the Spens Committee said at all. What the Spens Committee was laying down was a scale of remuneration for individual general practitioners. That stood out plainly right through the report. In his submission, to scale down by reference to population was not giving effect to the Spens report but to something entirely different.

To Give Effect to Spens

Here were some 19,200 general practitioners giving full service—there was no suggestion at all that the doctors in the N.H.S. were not working hard—and the only way of giving effect to the Spens recommendation was by means which would ensure that these were remunerated on the Spens 1939 scale, with the necessary adjustments to cover the change in the value of money and the increase in remuneration of other professions. It could not be supposed that the amount of work of the doctor would increase merely *pari passu* with the population, but everyone knew that the amount of work would increase when people were not paying directly for the service. The only way of giving effect to the Spens recommendation was to scale up the adjusted net income, which Spens said ought to be secured, by reference to the increase in full lists, not having reference to restricted lists.

A figure of 19,227 practitioners doing full service had been put in for the year ending March 31, 1951. That was arrived at in the following manner. From documents pro-

vided by the Ministry it appeared that the total number of general practitioners in the National Health Service on that date was 19,945. The number who had restricted lists was 887, leaving 19,058. The comparable figure on January 1, 1952, was 20,640, of whom 990 had restricted lists, leaving a total of 19,650. What the Minister had said was that what ought to be taken was the number of general practitioners who were serving throughout the year. But supposing Dr. Smith was serving for the first part of the year and Dr. Jones for the second half, neither of them would have served throughout the year, or would come into the Ministry's calculation, but surely they ought to count at least as one. The method by which the Committee had arrived at its figure was as accurate as it could be made.

Practice Expenses

He turned next to practice expenses. On the basis of information available the Committee claimed that the ratio of professional expenses to gross receipts for the year ended March 31, 1951, should be taken as 38.7%. Here he read a long document which had been prepared on this subject. With the agreement of the Association, the Inland Revenue authorities were asked to carry out an investigation into the level of practice expenses in the year 1949-50. A sample of 3,145 principals was selected by the B.M.A. from its records. Doctors known to have salaried appointments were excluded; otherwise it was a random sample, and practices were classified as rural, semi-urban, and urban. The names of the doctors were communicated by the Ministry to the Inland Revenue, who arranged to extract from income-tax returns particulars of the practice expenses allowed.

Of the original sample of 3,145 cases 2,775 forms were returned by the local inspectors. For various reasons, principally because many of the accounts were made up to a date earlier than December, 1949, a large number had to be discarded, and finally the number of doctors in respect of whom information was transmitted to the Ministry was 1,066. On consideration of these figures it was agreed that regard must be had to the substantial payments made to doctors in the first three months of 1949 in respect of the period to July 5, 1948. For these reasons and also to secure that the information related as nearly as possible to the year ending March 31, 1950, many other cases were disregarded, and the balance, concerning doctors whose accounts were made up on an earnings basis to dates between January 1 and March 31, 1950, numbered only 449—a disappointingly small number.

This, however, formed the basis of the investigation into practice expenses. It was sought to agree on an average expense ratio for all doctors. The arithmetical average for the 449 cases gave a ratio of 35.5%, but at a meeting between the two parties the actuary for the B.M.A. said that in his opinion the figure should be adjusted to 37.5%. In an endeavour to reach agreement the Government Actuary's Department suggested 36.5% as the maximum to which the Ministry was prepared to go, but the B.M.A. refused to move from their figure of 37.5%, and so no agreement was reached.

The actuaries were next asked to consider what expense ratios should be used to calculate the notional net remuneration figures from the statistics of the gross payments made to doctors in the year ending March 31, 1950, as recorded in returns received from executive councils and hospital management committees. A classification of 36 groups was agreed for expense ratios, and these expense ratios, when applied to the corresponding sectional totals of gross remuneration obtained from the executive councils' returns, gave an overall average of 36.5%. The B.M.A. made it clear that its collaboration in devising the expense ratios for the 36 groups was without prejudice to its claim that the overall figure should be 37.5%. The Ministry, on the other hand, was inclined to think that it would have been better to use for the overall expense ratio not 36.5% but the

35.5% actually given by the average of the 449 cases, and on this and other grounds the Ministry was now contending that the appropriate practice expense for the year 1949-50 was in fact 35.5%, and not 36.5%.

As for the variation in expenses for 1950-1, in the view of the Ministry the total estimated expenses for the year ended March 31, 1951, might represent about 37.7% of the total gross income for that year (excluding compensation interest and Exchequer superannuation contributions). The Committee's figure was 38.7%.

The Committee's figure of 38.7% was obtained by taking the figure which the Government actuary had been prepared to concede but which the Association had not at first seen its way to accept—namely, 36.5%—and adding the increase of 2.2%, by which, in the year ended March 31, 1951, practice expenses absorbed a still higher percentage of gross receipts.

It was necessary to bear in mind that after the offer was originally made a larger sample was taken. The cases of which one could not get particulars were likely to be the smaller practices, and it was well known that the expense ratio in the smaller practices was likely to be higher than in the larger ones. The samples were probably unduly weighted on the side of larger incomes. There were several categories which would tend to make the figure thrown up by the Inland Revenue calculation—35.5%—too low, and on the evidence of the document he had read it would be reasonable to take 36.5%, which the Government actuary originally offered, as the figure for 1950, and to add to it the 2.2%, making it 38.7% for 1950-1. This was against the Ministry's figure of 37.7%, which was in turn based on the 35.5% for the earlier year.

Receipts from Sources Outside Central Pool

Mr. Grant then dealt with certain smaller items—remuneration under Parts II and III of the Act, and remuneration from other Government departments. The gross receipts of practitioners in the Service from sources outside the Service had been put down by the Committee at £1m. The Ministry's estimate was £4.334m. It was not suggested that there was any solid basis for this estimate, but the Ministry assumed that all practitioners with unrestricted lists were making an average of £150 per annum. Obviously it was quite impossible to give accurate estimates, but his instructions were that that figure was far too high. He must wait to see on what it was based.

One item did not appear on his list at all. It was an item described as interest on compensation, and amounted to the substantial figure of £1.420m. in 1950-1. That, in his submission, was not professional remuneration or remuneration at all, but a payment by way of compensation to doctors who had been deprived of a capital asset—namely, the right to sell the goodwill of their practices. These were not professional earnings. They had nothing to do with services rendered under the scheme. They ought not to be taken into account at all, and were rightly excluded from the Committee's computations.

The figure which in his submission was required to give effect to the Spens Committee's recommendations for the year 1950-1, so far as concerned general practitioners in the Service, excluding those with restricted lists, was £57.173m. To this amount were to be added the estimated receipts of practitioners with restricted lists—namely, £0.155m.—which was brought up to £0.205m. with the addition of the betterment factor. These practitioners with restricted lists were receiving from sources outside the fund—practically all of it under Part II of the Act—£705,000. That was nearly all paid for specialist services, as consultants in hospitals and so on, or as senior hospital medical officers. It was right to shut this out of the general calculation, because this £705,000 came from sources other than the pool.

• How the Central Pool should be Calculated

To recapitulate:	£ millions
Gross receipts of general practitioners in N.H.S. (excluding those with restricted lists) for the year to March 31, 1951, to give effect to Spens Committee recommendations would be:	
Net income	47.002
Practice expenses	18.528
	65.530
Less gross receipts from sources outside N.H.S., say	1.000
Total N.H.S. remuneration for year	64.530
Add Service remuneration of practitioners with restricted lists, plus betterment factor	0.205
Total N.H.S. remuneration for all practitioners	64.735
Deduct receipts from N.H.S. sources, excluding payments from central pool and inducement fund:	
Additional mileage money	0.500
Maternity medical service	2.548
Drugs	1.298
Sight-testing	0.176
Training grants	0.385
Cottage hospitals	0.176
Exchequer superannuation contributions	2.274
	7.357

With this final deduction the figure for the central pool for the year ended March 31, 1951, should have been £57.378m.

Evidence of Statistician

A memorandum of evidence by Professor R. G. D. ALLEN, professor of statistics, London University, was read by Mr. Hylton-Foster, and Professor Allen afterwards went into the witness-box for cross-examination by the Attorney-General.

In his memorandum Professor Allen showed in great detail the changes in the value of money and standards of living between 1938 and 1950. He exhibited a table giving the changes in aggregate money and real income between those years. This showed that, among earners, only the professional classes in the aggregate had lost ground. At the other end of the scale, wage-earners had gained about 30% in real consuming power since 1938, apart altogether from increased benefits from social services in cash or kind. Property owners, or the property incomes of persons who might also earn, had come off worst. Even with undistributed profits included, the aggregate of property income after tax was worth less than three-quarters of its pre-war value. The corresponding figure for distributed income only was about 60% of pre-war value. For incomes of £1,500 and over in 1938 the loss in standard of living must be at least 25%.

A massive redistribution of purchasing power, said Professor Allen, had taken place. The middle classes might have been impoverished to such an extent that they could no longer serve effectively in providing public service and cultural needs.

He addressed himself to the question of what increase in earned income a professional family should receive to maintain their 1938 position within the professional group as a whole—in other words, “to keep up with the Joneses.” To do this the doctors should have their incomes about doubled. Earnings corresponding to £1,000 in 1938 should by the end of 1951 be £2,400, and earnings corresponding to £1,300 in the earlier year should be £3,020.

A general practitioner who earned £1,000 in 1938, plus property income of £275, would need in 1950, to maintain his position in the hierarchy, a total income of £2,200, of which about £400 would be corresponding property income and £1,800 professional earnings.

Professor Allen's conclusions were that the real national income per head of disposable income in terms of amount for goods and services increased by about 7% between 1938 and 1950. Wage-earners gained by 20 to 25% in that period, apart from the additional benefits in cash and kind obtained from the social services. Other economic classes in the community had sustained corresponding losses in standard of living. Professional and higher salaried classes had lost heavily because their real income was 20 to 25% lower than in 1938. This was the result of deliberate economic policy by the Government. It would require unemployment on a catastrophic scale or a complete reversal of social policy to wipe out the gains of the wage-earning group.

It must be assumed that general practitioners, like other professional men, had accustomed themselves to a standard of living lower than they achieved in 1938. They were supporting a large and increasing Government expenditure on defence and general administration; they had received smaller increases in pay or fees than wage-earners; the incidence of indirect taxation and other factors had made the things which they bought dearer than for the working classes. And the question was, What rise in income over 1938 was needed to keep the general practitioners, as a group, no worse off than other professional and higher salaried workers? There was an estimate of a loss in living standards in this group since the war; this loss was greater at the higher income level and could be calculated at 17½% at the £1,000 level of pre-war income. Therefore, as he had said, to maintain equality with the Joneses in 1950 the general practitioner would need an income of £2,200.

Cross-examined by the Attorney-General

Sir LIONEL HEALD: Are general practitioners any worse off than other professional or higher salaried workers?—A. Yes.

Q. It is quite clear that general practitioners among other professional men have unfortunately suffered a loss of relative status since the war?—A. Yes.

Q. You point out that the redistribution of the national income has favoured what you describe as the working class substantially at the expense of the professional classes?—A. Yes, including in “professional classes” salaried earners and particularly higher salary earners.

Q. You have pointed out that the working classes have “mopped up” a good deal of the purchasing power; 22% is the figure you mention. Is that really relevant?—A. Yes, in a sense. I start by trying to take the whole distribution of the increased income, and therefore it is relevant, if one set of people have lost, to see which set has gained.

Q. The position is that you are not suggesting that in order to put the general practitioners in their proper position in the post-war scale they should be equated with the increase that the working classes have obtained?—A. Not at all.

Q. In addition to having lost their relative status, it is also true, is it not, that the professional classes, such as the doctors, the lawyers, and people like that have in fact suffered a substantial loss of relative status for the benefit of and to the advantage of the managerial hierarchy and the Burnhamites and so on?—A. They are among the salary earners that I bracketed with professional earners in some cases.

Q. In fact you have, because of the difficulty of separation, been bound to lump in doctors with people who are in the new professions, such as people in the Coal Board, who in many cases are better off than the doctors?—A. Not always; sometimes we can distinguish between professional earners; that is the earners who work on their own account, and salaried earners, which often include the same people.

Q. Let us get down to it. When you get your 120% it would include doctors and what I call the Coal Board people?—A. Yes.

Q. You have arrived at the final figure of 119½% increase being necessary to maintain pre-war standards after considering what is necessary to maintain the pre-war standard of life at £1,000 a year and £1,300 a year?—A. Yes, and I also averaged the earnings in 1937-8.

The Attorney-General then questioned Professor Allen on the method he employed in arriving at his figures.

Q. The first result you get in para. 22 of your memorandum is an increase of 80%? Taking everybody who is getting more

than £1,000 a year, their earnings have gone up by 80%?—A. Yes, for 1949–50.

Q. Supposing that some managerial people have, so to speak, rushed their way in and got ahead of the professional man, then according to your view he would be taking one of their places, would he not? The relative distribution would have changed?—A. If people have thrust themselves ahead of him, yes.

Q. You are saying that he ought to be put back where he was before?—A. Yes, but not necessarily by pushing back the same interlopers. There is always a shift in these matters.

Q. So that it is not a question of the actual position but of putting him in the same relative position as he was before?—A. Yes.

Q. These people in the majority of cases are not people who would be regarded as members of the professions in the ordinary sense of the word?—A. No, this distribution of incomes includes everyone.

Q. Those people who have pushed the professional man down the scale are not people who in the ordinary sense of the word would be described as members of a profession?—A. Oh, no, they could be "spivs."

Q. Surely you do not take account of the presence of "spivs"?—A. It is the Inland Revenue approach—an approach solely of incomes.

Q. I think we understand where we are, and please do not think I am criticizing your method, but it does involve this assumption, that you are going to make some kind of allowance for this, that the professional men have to a certain extent been thrust behind by others and you think they ought to be restored?—A. It is not a question that I think they ought to be. I have not used the word "ought" at all. I was making a calculation of the income they would have to get up to the same relative position.

The witness was next questioned about his Section IV method. He said that in working out his figures for Section IV he had started from the top of the income ranks and had gone down, irrespective of who was earning the income. The earners would be mainly the upper-salaried people.

Q. In para. 23 you say that most doctors own some property. Therefore we may assume that on the average doctors have relatively as much property as anybody else—is that right?—A. Not necessarily.

Q. You cannot take out the property element and therefore you are considering both together?—A. That method of proceeding is an accident following from the nature of the data available.

Q. Would you say to what your 80% applies?—A. That figure of 80% applies to earnings, but it is on the assumption that the person is maintaining his position, including his property income.

Q. That 80% does not include what you want and so you start again?—A. We do the same exercise, but the earned incomes are now distributed from the top downwards instead of taking the total incomes, for which the basic data are not so readily available.

Q. Do you ever use in this memorandum that figure of 80% again?—A. No, it was taken purely as an illustration.

Q. Are the data for 1937–8 given in Table 5 of very much help to us?—A. I am quite used to making rough approximations and I have satisfied myself that my approximations are reasonable. The data for 1937–8 are missing to a large extent.

Q. Would it be unfair to say that what the data give you are certain points which enable you to construct a graphical representation?—A. Yes.

Q. This enables you to put general practitioners in the same position as before the war relative to the whole class. Would you define that class?—A. It cannot be defined in any other way except as those who earn incomes down to a certain point on the scale.

Q. What sort of people does it include? First of all professional people and then managers and executives in industry; who else?—A. It includes all salaried earners above a certain point—for example, Civil Servants. It would include independent business men who do not earn a salary but who obtain an income from their business.

Q. All you have really excluded are people who derive their income from investments and property?—A. Yes.

Q. May we now look at your No. V? Would you disagree that No. V is a somewhat speculative exposition?—A. In a sense it is all speculative.

Q. Does it not depend on rather more questionable assumptions than the others?—A. Perhaps you will specify what you mean.

Q. Can we look upon it as involving a more dubious hypothesis?—A. No, neither more nor less.

Cost-of-living Comparisons

Professor Allen was next asked whether there was not a good deal of controversy about the comparison between the cost-of-living figures before the war and now, and whether it was not fair to say that one was moving in a very difficult field in the attempt to give separate figures for the increase in retail prices for different sections of the population. He replied that it was a difficult thing to do. Any one figure given could be attacked, and all figures were subject to a margin of error. His only safeguard was that he had adopted two methods and had got broadly the same result by both.

Q. Are you arguing that because you have got the same result by two methods then both those methods are right?—A. No, they might be both wrong.

Q. When you speak in Table 6 of upper middle-classes is there any way of differentiating them or have you merely based them on income?—A. On income, yes.

Q. What is the figure for the middle-class? The middle-class in 1938 was taken as persons having an income of over £500 a year?—A. Yes, that is right.

Q. That would quite possibly include the "spivs" again?—A. Yes, that relates to the purchasing power of people's incomes.

Professor Allen was next questioned about a figure which he had given—namely, 17½%—as representing a reduction of income, and was asked how he arrived at that figure. He replied that it was based on what was called real post-tax income or income after paying tax. It was an index of standard of living in this sense, that it meant the income after paying taxes and in terms of command over goods and services.

Q. Where do you get that 17½%?—A. If you look back at Table 2 you will find that in 1950 my calculations concerning professional earnings were between 80 and 85% of total income, in terms of post-tax pre-war income. I took 82½% as the average of those two figures, and the difference between that and 100 gave me the 17½% reduction. But in addition to that it appears from that table and also from other calculations that have been published recently that at certain levels the cut in real income per head did turn out actually to be round about this figure of 17½%. It means no more than that in the end 17½% is the typical reduction in real income.

Q. Why do you put it in Table 7? You say that if there had been no changes in the standard of living you would have to assure me, if I were a general practitioner, an income of £2,980 a year, but I as a general practitioner am not going to ask you to give me that income because it is subject to the 17½% reduction.—A. There is the same implication here as in an earlier section of my memorandum. It is a question of "keeping up with the Joneses." The 17½% is the reduction in the living standards of real incomes per head in the case of professional earners and upper-salaried earners in 1950.

Q. It means that you have failed to live up to the increase in expenditure by 17½%?—A. Yes, the Joneses, with whom you are supposed to be keeping up, have lost 17½%. That figure pertains to the professional groups and I think it also applies to the upper-salaried earners. It does not necessarily apply to other groups like farmers and independent earners.

Q. When we get to incomes like £1,300 we find there a 25% reduction?—A. Yes, that is because any loss in real income per head increases as we go up the income scale.

Q. That is a broad statement, not a calculated figure?—A. The 17½% does appear to apply more or less to incomes at the average level of just about £1,000. As you go up in income the real income is known to decline. It has been shown that there is a graduated loss in real income as you go up the income scale, so that the figure of 25% is put in in the attempt to allow for that effect. It is more of a round figure, admittedly, than the 17½%.

It was further pointed out that the 25% incidentally is about the measure of the loss in standard of living sustained by property owners—that is to say, those who depend entirely upon property.

Q. When you refer to professional earnings do you differentiate between salaries and fees?—A. Yes, professional earnings are those which are received when a person is working on his own account. A professional man earning a salary would be regarded as a salaried man. It is the income from fees or other operations on account of the man in question which is taken here.

Q. Comparing 1938 and 1950, there has been a change in the method of estimation which makes all comparisons seem unreliable, has there not?—*A.* If I may make a general statement, in 1938 the figures were rather different and not as fully detailed as they have been since. A good deal of the statistical material we now have has been developed since 1938. In any case, even if that were not so, a comparison over ten years in any matter of this kind is difficult to interpret.

Q. Is it true to say that in 1950 figures were available though incomplete, but in 1938 they were largely lacking?—*A.* Yes.

Q. Does that not make it rather a speculative thing?—*A.* I think the information available is sufficient to produce the kind of ranges which I have given in my memorandum. There is information of various kinds which has had to be taken into account.

Finally Professor Allen was questioned on property income. Attention was drawn to his statement that property income had increased to a less extent than other kinds of income.

Q. On the other hand, the earned income of non-professional people, such as farmers and traders, has risen considerably more than the income of professional people?—*A.* Yes.

Q. Is it not, therefore, fair to say that earned and unearned income, including property income, would provide a fairer basis of comparison than earned income alone?—*A.* Not in this context. The context is the earnings of the practitioners. If you were considering total income then you would use that method. To the extent to which general practitioners have property income, that property income is outside this consideration. It has been cut automatically. The argument is about the earned part of the general practitioner's income. To the extent that the general practitioner has property income he has already suffered a certain loss on his property holdings.

The cross-examination of Professor Allen by the Attorney-General had not concluded when the proceedings were adjourned until the following day.

SECOND DAY

Wednesday, March 19

Professor Allen's Cross-examination Continued

On the second day of the inquiry Professor R. G. D. ALLEN went again into the witness-box to answer a few further questions in cross-examination. The Attorney-General drew his attention to the terms of reference of the inquiry, which mentioned the change in the value of money since 1939 and the increases in the remuneration of other professions. He thought that Professor Allen had said on the previous day that so far as he was concerned no information was available as to the increases which had taken place in incomes in other similar professions as compared with the incomes of general practitioners.

Professor Allen replied that that was not quite so. He had used two methods, one of which included all incomes, and the other was appropriate to higher salaried and professional earnings.

Q. I am not concerned with your calculations at the moment. The actual statistics giving the relative position of professional men working on their own account, relating to the periods before and after the war, are not available to you?—*A.* Not from the Inland Revenue.

Q. If we could get figures which gave you, for example, the position with regard to lawyers and members of similar professions, obviously that would be a helpful thing?—*A.* Yes; if they were averaged out, not confined to particular groups.

Q. At the moment we have not got those figures. If we could get them they would be of assistance?—*A.* Oh, yes, certainly.

Q. You would obviously like the opportunity of considering them and criticizing them, but they would be helpful?—*A.* They would be helpful.

Re-examination

Mr. HYLTON-FOSTER, after questions to elucidate how they would be helpful, asked: If one is looking at the recruitment aspect of the matter it is essential to take into account that a few block of people have got into those ranges of income?—*A.* That was my interpretation of the Spens recommendations, that the general practitioner should keep up with all people in the income range.

Q. The terms of reference of this inquiry refer to "all other relevant factors," do they not?—*A.* Yes.

Q. The Attorney-General was referring to some of your comparisons as speculative. I would ask whether in your own view your conclusions expressed in this memorandum are not reasonable, accurate, and reliable?—*A.* Yes; I admit that they are speculative, that is why I have gone into them in great detail in various ways. A certain amount of judgment is involved, but my attempt has been to get the best estimate. There is no bias. The figures may be too high or too low, but they are the result of unbiased judgment, taking into account a large number of factors.

Q. You have indicated where you have exercised judgment owing to limitation of data?—*A.* Yes.

Q. And you yourself are of opinion that your conclusions are reasonably sound and accurate?—*A.* Yes.

Before this witness left the box Mr. Hylton-Foster said that owing to the course which the proceedings took on the previous day he had had no opportunity of introducing Professor Allen. Professor Allen held the chair of statistics in the University of London and he had been concerned with the study of economics since 1928.

THE MINISTRY'S EVIDENCE

The ATTORNEY-GENERAL said that one matter arose out of the questions which he had put to Professor Allen. The terms of reference of the inquiry directed consideration of the increases which had taken place in incomes in other professions—he assumed that this meant similar professions—but at the present time they were not in a position to consider any figures which gave a comparison of such incomes before the war and after. Professor Allen had said that there were no such figures available. In view of that it did seem to him that they were working to some extent in the dark and that his Lordship's task had been made more difficult by the absence of such figures. He considered it his duty therefore to ensure that his Lordship had any information which was available, and in fact he had been told that there were actually certain figures which could be produced by a responsible officer of the Inland Revenue and that these figures would at any rate give some assistance as showing the difference in the incomes of those professional men who worked on their own and who might be regarded as in certain respects comparable with general practitioners. He was, however, in this difficulty: the gentleman from the Inland Revenue who was able to give those figures had been, as they could imagine, extremely busy during the last week, engaged from day to day in the House of Commons. He hoped that he would be in a position to attend the inquiry on the following morning and give his Lordship the best assistance he could.

Mr. Justice DANCKWERTS said that he would like to have that assistance.

The ATTORNEY-GENERAL added that the figures which that witness would produce had not been published, and as they related to only one section he was instructed that the figures should be given in closed court.

Mr. Justice DANCKWERTS pointed out that if the figures were commented on the comments would be made in open court.

The ATTORNEY-GENERAL said that it was simply a question of not publishing the tables which he would produce.

Mr. GRANT said he had no objection to this procedure, although it was rather late in the day to bring in an influx of new figures.

Mr. Justice DANCKWERTS: We had better have them and see what their value is.

The ATTORNEY-GENERAL then said that he proposed to call three witnesses in support of the general statement of the case put forward by the Minister of Health and the Secretary of State for Scotland.

Evidence of Deputy Accountant-General

Mr. A. J. F. DANIELLI, Deputy Accountant-General in the Ministry of Health, was called to the witness-box and examined by Mr. Granville Slack for the Ministry.

Mr. DANIELLI said that he was responsible under the Accountant-General for the Division which dealt, among other matters, with the finances of the general medical services provided under Part IV of the National Health Service Act. He had been closely associated with that work since 1947. He had been concerned with the working out of the figures from that time onwards and also with the discussions which had taken place with the British Medical Association. He was also responsible in connexion with the present adjudication for preparing some of the figures which appeared in the Ministry's documents.

He was first asked about the constitution of the central pool. He said that the central pool was not a statutory arrangement. It was constituted by the Ministers in agreement with the British Medical Association and was an administrative arrangement for giving effect to the statutory provisions of the Act, and, of course, the money which was used to provide the central pool came from money provided by Parliament. The central pool was the main source from which general practitioners providing general medical services were paid. From the central pool were paid what were known as inducement payments, capitation fees, payments in respect of temporary residents, payments for treatment given by a practitioner in an emergency to a person not on his list, and payments in respect of mileage (not the entire payment but some two-thirds of the payment in respect of mileage came from the central pool). From the central pool was also made the payment in cases in which a practitioner was required to provide the services of a second practitioner for administering an anaesthetic.

Mr. Danielli was asked to explain what was an inducement payment. He said that an inducement payment was an addition to the fixed annual or capitation payment and was originally intended to increase the incomes of doctors practising in sparsely populated areas or sometimes in what were known as less attractive areas. Curiously enough they had not been able to find doctors who wanted this money. The sum of £400,000 had been provided for this purpose, but they had only spent roughly £30,000 a year on this particular item, and part of that money had not been paid to induce practitioners to settle in certain areas, but, by agreement with the British Medical Association, it had been paid to practitioners whose practices had fallen in value since the introduction of the National Health Service. In the early part of 1948 the B.M.A. made representations that the money going to rural doctors was not sufficient, and, by agreement with the Association, a sum of £200,000 a year was diverted from the Inducement Fund and added to the Mileage Fund.

Effect of Inflation

In reply to a further question, the witness said that the present lists were inflated very considerably. There were 168 executive councils in Great Britain, and in the areas of about 70 of them the number of people purporting to be on doctors' lists exceeded the total population.

Mr. Justice DANCKWERTS asked how this inflation had arisen.

Mr. DANIELLI replied that quite a lot of inflation arose as a result of the old National Health Insurance arrangement. At the outset of the N.H.S. people were told that if they were on the list of an insurance doctor they need not register again. Then, further, people moved about and many of them seemed reluctant to tell a doctor that they had been already to another doctor, so that the doctor to whom they went eventually, in all good faith on his part, took their names on to his list.

The witness next entered into the calculations which were made to determine the size of the central pool having regard to the recommendations of the Spens Committee. The estimated total of the 1939 gross income of general practitioners was £28.14m. To this was added the Spens increase of £3.1m., making a total of £31.24m. The 55% increase in practice expenses as between 1939 and 1948 accounted for £6.24m., and a 20% increase on adjusted 1939 net income

another £3.98m., making a total of £41.46m. To this was further added £1.24m., representing a 3% addition for the increase in population 1939-48, and from this figure a 5% deduction was made—namely, £2.13m.—on account of people not using the Service. The total figure thus arrived at was £40.57m. gross. Expenses on the 1939 income were taken as £11.35m., and to this the 55% increase (£6.24m.) was added, making £17.59m. The net figure, irrespective of the addition for increase in population and of reduction for non-users, was thus £23.87m.

Mr. GRANVILLE SLACK: There were no real figures available in 1948 to show what the increase in practice expenses should be, and 55% was taken as the nearest that could be found?—A. Yes.

Q. I think 3% has always been taken for increase in population between 1939 and 1948?—A. Yes.

Q. And then you take off 5% to allow for people not using the Service?—A. Yes. What happened at the time was that nobody really knew how many people were going to make use of the Service. The B.M.A. in discussion with us pointed out what happened at the beginning of National Health Insurance, when there was considerable delay on the part of insured persons in taking advantage of the scheme. It was thought that in the early days there might not be more than 60 or 70% of people making use of the Service. But on the other hand the profession had agreed to accept collective responsibility for the whole population, and finally it was agreed that 95% should be taken in the pool to cover, not necessarily people actually on doctors' lists, but the people for whom doctors were at risk in accordance with their terms of service.

Q. And you found that was approximately 18s. per head for 95% of the population?—A. Yes.

Q. Has the central pool been calculated on that basis?—A. It has been calculated quarterly on that basis.

Q. And on figures of population supplied by the Registrar-General?—A. That is so.

Other Payments to Practitioners

With regard to the Inducement Fund, this came rather "out of the blue" in discussion with the British Medical Association. When it was agreed that something should be done to encourage practice in sparsely populated or unattractive areas nobody knew how much it would involve. Therefore 1% of the central pool was taken to provide money for that purpose.

The next item was additional mileage money. This again was paid on the representations of the profession. Early in 1949 it was stated that the remuneration of rural practitioners was inadequate, and it was agreed to divert £200,000 from the Inducement Fund, and the Government provided another £500,000.

The next item concerned payments for maternity medical services, an estimated figure for the year ending March 31, 1952, of £2.665m. Payments for provision of drugs were estimated for the same year at £1.417m., payments for sight-testing at £0.131m., and payments for training assistants at £0.419m. He added that the initial rush for spectacles was beginning to fall off, and the figures showed a decrease over each of the three years taken into account.

Turning to Part II Services under the Act, the witness referred to the amounts for cottage hospital staff funds, part-time medical officers at convalescent homes, and part-time consultants and senior hospital medical officers. The amount estimated for part-time consultants and senior hospital medical officers for the year ending March 31, 1952, was £1.276m. He explained that this related to general practitioners who held such appointments; they were paid on a basis proportionate to the full-time remuneration for the particular job. Figures had been obtained from nine regional hospital boards who were asked for the latest figures relating to part-time consultants, and these showed increases over the three years ending in March, 1950, 1951, and 1952. All he was attempting to show was that the total payment for part-time consultants over those three years was increasing. Over the same three years there had been a slight decrease in the figure for part-time senior hospital medical and dental officers. But the B.M.A. criticism that these figures were

falling, was hardly borne out by the numbers he had quoted. Over the whole field of these part-timers the figures were not decreasing.

With regard to Part III Services, these included local authority services, such as care of mothers and young children, midwifery, vaccination and immunization, and mental health. The final amount of these payments could not be known until after the accounts of the local authorities for that particular year had been audited, and only estimates were given. The total amount estimated for each of the three years was £367m. There had been a substantial fall in payments for midwifery, but there were compensating increases under other headings.

He then described the work done by general practitioners under other Government departments, such as the Ministries of Pensions, Labour and National Service, and National Insurance, the General Post Office, the Civil Service Commission, and the War Office, Admiralty, and Air Ministry.

He next turned to the question of interest on compensation. He said that the Act prohibited the sale of the goodwill of the medical practice of a general practitioner who was providing general medical services under it, and a sum of £66m. was provided as compensation to general practitioners in Great Britain for the loss of the right to sell such goodwill. The compensation attached to the goodwill of an individual practice was normally payable on the death or retirement of its owner, and interest at the rate of 2½% per annum was paid in the meantime on the amount of compensation remaining unpaid. This interest was clearly new income not enjoyed by general practitioners in 1939. It would, of course, diminish gradually as capital payments were made, but the whole sum of £66m. would not be dispersed for some 30 years.

Mr. Danielli agreed that he had included superannuation payments and contributions by the Exchequer in his figures. The figures which appeared in the Ministry's case so far as they related to the change in the value of money were based roundly on the figures of national income contained in the Government's White Paper: The figures relating to the working classes were taken from the *Ministry of Labour Gazette*. In calculating the central pool the figures for the population were obtained from the Registrar-General. The number of doctors was not used in calculating the amount for the central pool.

In the Ministry's case the remuneration of practitioners in 1939 was computed by taking a gross income figure of £53.243m. for 1950 and £53.798m. for 1951, and these figures were reduced by practice expenses to £35.692m. and £34.987m. respectively for the two years.

Mr. Danielli was asked how he arrived at the figure of £150 a year as the average amount received by a practitioner in the Service from private practice. He explained that the Ministry had started with the sample which was taken for the investigation into practice expenses. An average was struck and the total remuneration from all professional sources was compared. The average amount received by the 761 doctors whose incomes were taken in the practice expenses inquiry was £1,853 for the year 1949-50, and the sum received, after proper adjustments, from the N.H.S. was £1,681, the difference between the two being £172. This was a figure based on what he regarded as a sizable sample, and it was reasonable to assume from that figure that general practitioners as a whole in the Service must have been deriving from private practice an average amount of somewhere between £100 and £200. Not a great deal was known about this, but it seemed not unreasonable to take an average figure of £150.

Cross-examination of Mr. Danielli

Mr. GRANT cross-examined Mr. Danielli first of all on the formula for working out the amount to go into the central pool.

Q. I think we are agreed that to arrive at the formula for working out the amount to go into the pool it is proper to treat income and expenses separately?—A. Yes, that is reasonable.

Q. So far as the net income is concerned we start with the figure of £19.89m., being the 1939 income adjusted to give effect to the Spens increase?—A. Yes.

Q. And the expenses are to be computed by a percentage on the estimated gross earnings of the year one is dealing with?—A. Yes.

Q. We differ as to the percentage?—A. Yes.

Q. I gather that you do not agree that we are doing the right thing in scaling up the Spens net figure by a reference to the number of doctors giving full service in the scheme?—A. No.

Q. Am I right in thinking that what the Minister says is that you have to make two allowances: (1) you scale up a figure by reference to the estimated increase in the population and (2) you make a deduction, which we will call 5%, to allow for the part of the population which does not use the scheme?—A. Exactly.

Q. Is the Ministry in a position to give me a calculation how you compute these items? So far we have not had it. Have you got a formula?—A. I am not quite sure what you have in mind.

Q. It is quite simple. We have given you the way we think it should be worked out, we want to know how you work it out.—A. What we have done is to take the pre-war incomes; we have added to that the £3.1m. for Spens, we have then loaded the resultant figures to take account of the increase in the population, and we have then deducted from them 5%.

Q. That is what you have done down to date?—A. The Minister has made these calculations quarterly on up-to-date figures; the only figure which might be said to be out of date is the current expenses ratio.

Q. What you have done is to take the 1939 estimated figure of expenses from Professor Bradford Hill's calculations and add 55%. That is not the method you suggest for the future?—A. We suggest for the future that we should apply at agreed intervals such figures as are actually drawn up by the Inland Revenue.

Q. For the particular year, 1950-1 you suggest applying 37½% to some figure or other?—A. We apply it to an ascertained figure. We apply 37½% for 1950-1 by adding a figure obtained from the Inland Revenue authorities to load the figure they obtained on our behalf for 1949-50.

Q. I am not quarrelling with that for a moment, but it is quite different from what you have done so far, is it not?—A. In a sense, yes. What we have done so far is to take the figure ascertained from Inland Revenue sources before the war and apply 55% to that, and, of course, we have adjusted that figure to take account of the increase in population, because that has been taken right through, but there has been no broad rule to get more accurate figures. We are lacking figures, if I may say so, in respect of the period following the introduction of the National Health Service Act. The first complete financial year after that Act came into operation ended on March 31, 1950, and we have taken the figure for that year. We could hardly have done anything else.

The Question of a Formula

Q. I am asking you what formula the Ministry is inviting his Lordship to adopt in order to work out the correct amount to go into this fund, because this has to be done every year. What I am asking you to enlighten us on is your formula. It begins at some stage with £19.8m. Could you put it down on a piece of paper.—A. With respect I would say "No."

Q. Why not?—A. I find it difficult myself to suggest that you can define a formula to deal with practice expenses; they are something which vary from year to year. I have no doubt that the profession will say that for the forthcoming year there will be a jump in practice expenses owing to the increased cost of petrol. This is something which has to be ascertained.

Q. But in principle there is no dispute. We had agreed that practice expenses are to be worked out by applying some percentage. There is not a great deal of difference between us on the method of estimation; on the amount there is a difference. In principle what I want to see is your whole calculation. Where do you add on 3%, and where do you deduct the 5%?—A. If I understand you rightly we are looking at the central pool, we add the 3% or a corresponding figure. Every quarter the Registrar-General gives us the population figures.

Q. Will you help me on this, because it is the whole of your case. If I were to sit down to work out the basis to which you say his Lordship should direct his attention, I begin with an amount of £19.8m., the suggested Spens net income. What do I do next?

The ATTORNEY-GENERAL: Is this before or after the adjudication?

Mr. GRANT: I have made my position clear. What I want to know is what the Ministry's case is, and I am struggling to find

out. I want to know how you do it.—A. I am saying we should do it in the same way as we do at the moment, by taking into account the adjustment of the population quarterly.

Q. That is a general statement. May I press it? Starting off with £19.8m., what do you do next? Unless you tell me you have no idea what to do next I shall press it.—A. What I am saying is that I apply to that figure the factor representing the current population over the pre-war population.

Q. So that we scale up our £19.8m. shall we say by 3%. What next?—A. Then you have a figure which to our mind produces something comparable with the total pre-war income of general practitioners.

Q. What next? I will not say whether it is good or bad, I want to know what you do next?—A. We say, "Here is the pool calculated on this basis by loading it with the population, and this is what we distributed among general practitioners for the purpose of providing for such services as are paid for out of the pool."

Q. You have £19.89m., plus 3% for increased population. You are still on a 1939 basis with an addition for the increased population. Now, then, what is the next element in the calculation?—A. So far there has been a loading for betterment which in the past has been taken at 20%.

Q. What next, what about your 5%?—A. The 5% I think you have to allow for as and when you find out exactly how many people are on doctors' lists.

Q. We call it 5%. Let us assume you are right in saying that 5% of the population do not make use of the N.H.S. Am I right in thinking that, having added the 3%, you scale it up by some betterment percentage and then lower it by 5% for people outside the Service?—A. Exactly.

Q. Having done that, you would put in the amount for professional expenses?—A. Well, yes, you would do that. We have done all these calculations on a gross, not a net basis.

Q. I thought it was agreed to separate them out?—A. You are trying to take me through the steps which we take. In the past we have done it on the gross figure.

Q. We are not quarrelling about professional expenses. We are saying that at this stage you would put in a figure for professional expenses?—A. Well, I am bound to say that I think when we do these calculations in the future it will not be practicable to do it on a break-down basis. You will have to calculate on the basis of gross sums.

Q. Why?—A. Let us put it in this way. In any particular year you are going to pay a gross sum. We pay in gross sums to executive councils. The sums represent a certain capitation fee for 95% of the population. It is not possible in any one year to break that down and say that it represents so much net payment and so much practice expenses. To one doctor the practice expense figure is quite different from what it is to another. You are doing a quite useless sum if you attempt it in that way.

Q. Is it quite a useless sum when the figure which you have to start from is £19.8m., which is net income?—A. You start with the £19.8m., which is net income, I agree. I am not contesting that at all, but I am not saying that you can take £19.8m. and load it by certain factors to produce a new net income and then automatically say the amount should be x because the practice expense ratio is y .

Q. You have got this far, you have scaled £19.8m. by two factors—population and betterment—and you have scaled it down to exclude the people who are not using the Health Service, so that you have a maximum net figure. What we are trying to find out is how much gross these people have to get out of the pool, and you must add on to that some figure for expenses?—A. That is what we have done.

Q. That is what you have to do?—A. I agree that you must have a figure for practice expenses. I find it rather difficult to follow your line of argument. If you take a net figure and gross it up, what you have to do is to write it down to take account of actual ascertained expenses.

Q. Why did you agree with me, then, that you started with £19.89m., and scaled it up by two factors and down by one factor? That is where we got to.—A. That is how we started. We had to have a starting basis to get at a figure, and what we got was a gross figure.

Q. Do you say, then, that for the future you should not start with the Spens £19.89m. and scale it up or down?—A. No, what I feel must happen in the future is that we shall take whatever sum is awarded and build our calculations on that.

Q. You are not giving the Adjudicator very much help as to how he is to get that sum?—A. If I am not giving much help I am sorry, but I am trying to say what I think the position is and what it should be.

Mr. Justice DANCKWERTS here interposed to say that what counsel was asking, and what he himself wanted to know,

was how he, as Adjudicator, was going to get at that sum. The witness replied that such practice expense figures as they had got for 1950-1 should be taken, but there was nothing by which that figure could be loaded for 1951-2. In making his award the Adjudicator would have to look at that figure.

Mr. GRANT: You mean that in making his award for 1951-2 he will have to look at the figure which has been put in for expenses for 1950-1?—A. Exactly, because all the figures that are in front of the Adjudicator for 1951-2 are in the nature of estimates. There are no firm figures for that year. The Adjudicator will be indulging in a little guesswork if he tries to ascertain the practice expenses ratio for 1951-2.

Q. I am not interested in that. I am interested only in seeing what your document will look like. I understand you agree that having scaled up the £19.8m. twice and scaled it down once you add something for expenses?—A. That is what we did to arrive at the starting point. We got a gross amount which we proceeded to load. For the purpose of paying under the Act we are not really concerned with the practice expense ratio; having got the figure we pay in gross. The practice expense ratio only comes into the picture at the time when the profession comes along and says that the amount it is getting is not enough, that the expense ratio has gone up.

Q. You had come to saying what we are going to do with the gross figure once it is ascertained. There is a saying, "First catch your hare"—what we have to find out is what the gross figure is going to be.—A. We have to find that out, but the gross figure would be a figure related to 1950-1.

Q. I dare say.—A. When we have the gross figure, say £55m., the Minister would adjust it to take account of the population and then distribute it among the executive councils. One would not attempt to adjust it to take account of practice expenses until there was some data on which to do so.

Q. I am trying to get you to help me and his Lordship as to how to arrive at the gross figure for the year 1950-1; we will deal with the others afterwards. We have got the £19.89m. scaled up twice and down once, in order to get a gross figure; from there you must include practice expenses and there are things you deduct for earned income outside the Service. That is right, is it not?—A. Are we talking about the total remuneration of the general practitioner or the central pool?

Q. I understand that the £19.8m. was the starting point for doctoring all the people in the country?—A. Exactly.

Q. And you take off 5% because 5% of the population are outside the Service?—A. Yes.

Q. And what is left is what it is going to cost to doctor the people in the Service, on the assumption that the people outside are being paid for otherwise, and you do not have to provide for them. On your basis, now you are dealing with remuneration for the doctors in the Service, that is right?—A. Yes.

Q. And certain credits have to be given for remuneration from sources outside the pool?—A. Exactly.

A Matter of Deduction

Q. There are certain differences about detail, but there is one thing for which you cannot claim credit—any amounts paid by persons not using the services. In other words, you cannot knock out 5% at the top for the people outside the Service and then ask for credit to be given for fees paid by people who are not using the services. That follows, does it not?—A. Yes, but it depends on the angle from which you approach it. If you are looking purely at the remuneration I agree your suggestion is the right one, but if you are looking at the remuneration of all practitioners, as in fact we are, then you must take into account what is being earned from private practice.

Q. If you start off by looking at the earnings of all practitioners from all sources and deduct 5% because you are concerned only with the National Health Service you cannot deduct anything more in respect of payments made by people who are not using the National Health Service?—A. I am sorry if I am a little dense. We are talking about the way in which the Ministry made the calculations to start with. Are you now moving towards what the Adjudicator should do in the way of a formula?

Q. Everything I have done since yesterday morning has been done to help the Adjudicator to answer this question. I am putting to you the logical consequence of making the 5% deduction. It is a simple proposition that if you knock off early on in the calculation that 5% of the income on the ground that you are dealing only with the Service you cannot knock off anything else lower down for the fees paid by the 5% not using the Service.—A. I would not go as far as that. We are looking at the income of general practitioners from all sources; 5% has been deducted

as the amount which a general practitioner gets in the way of fees for patients who visit him in the ordinary way. There are private sources of remuneration which have to be taken into account.

Q. They are in fact extremely small?—A. Not necessarily.

Q. Are they not extremely small; I am putting that to you?—

A. They are not small, they are of the order of 10% of the total.

Q. I am putting it to you that they are extremely small; you are knocking off 5% from everything, not only of the private fees, but of the whole thing?—A. Five per cent. of the whole thing, I agree, but what I am saying is that although you take off that 5% in making the original calculation and put 95% into the central pool, that 5% does not all go to doctors outside the Service; some goes to doctors inside the Service, and you have to take that into account—what the doctors inside the Service get from that proportion of the population.

Q. That is your basis. I will put it for the last time. If you knock out 5% of the total up at the top on the ground that 5% of the population is outside the Service and you are not concerned with them, you cannot thereafter deduct amounts paid by private patients to anybody at all?—A. I would not go as far as that. In the figures which we have put before you I think the income of private practice is of a certain order; we have included a sum payable to some thousand doctors who are outside the Service.

Q. Your £150 per annum is not for doctors outside the Service?

—A. I am not talking about £150, I am talking about the thousand doctors outside the Service altogether, and we put in a figure which assumed a gross income for those doctors of the order of just over £3m.

Q. So what?—A. I am just saying that I have deducted 5% in one place and I shall assume that there are 5% of the doctors earning a certain amount of money.

Q. If you have knocked out 5% of the adjusted Spens up at the top to cover doctoring done to people outside the Service, will you explain what conceivable justification there is for knocking it out again lower down? You are taking out what these people are assumed to pay?—A. I am not taking it out. What I attempted to demonstrate this morning in suggesting how I calculate the £2.7m. for private practice was that the figure was obtained from the Inland Revenue and relates solely to doctors in the Service. I am entitled to bring that into account.

Q. I submit that you are not. I suggest that on your basis it is a wholly irrelevant figure.—A. I do not agree.

The witness was questioned about what Mr. Grant described as a formula he had put in. He said that it was a suggestion which the Adjudicator might look at in fixing a sum for the central pool.

Q. Where have you put the 5% in that document?—A. It is not there at all, for the simple reason that I adjusted the figure for the whole of the population.

Q. So that it is on quite a different basis from the one you were talking about this morning?—A. All I was talking about this morning was the scheme we adopted in 1948.

Q. That was not all you talked about?—A. It was all I intended to talk about.

Q. I will not comment on that for the moment. What this document says is that remuneration should be calculated on the size of the population and not on the number of doctors, which has nothing to do with the Committee's suggestions?—A. I would not agree.

The Different Approach

Q. Take it this way, then. The Committee's case is based on the number of doctors giving full service in the scheme?—A. Yes.

Q. Your figures are not based on that at all?—A. No.

Q. They are in fact on wholly different lines.—A. I do not agree. We are talking at cross purposes. What we have attempted to do is to develop a total of remuneration on the same lines as the Committee, with the simple difference that the Committee adjusted it for the number of practitioners and we used the population. That is the only difference.

Q. What you describe as a simple difference makes all the difference in the world?—A. It is a difference in approach.

Q. It is a completely different approach?—A. I do not agree, unless you say you start from population or doctors then you do start on a different basis, but the method of building up the figures is the same in both cases.

Q. We are building up figures for remuneration of doctors with full lists in the Service, that is what we are doing. You are building up remuneration for all doctors whether they are in the Service or whether they are not in the Service. You think that does not make much difference?—A. It is a difference of

approach; we are looking at what the remuneration of doctors should be to deal with a certain population.

Q. And you have produced a figure which you call the gross remuneration of all doctors whether in the Service or not?—A. Exactly.

Q. That includes a very substantial number of doctors with whom we have nothing whatever to do?—A. Exactly.

Q. You make deductions from that and you include in your deductions estimates of the remuneration earned by the doctors who are not in the Service at all?—A. Yes, but you observe that I deducted that.

Q. You deducted it in order to reduce the amount you say the pool should be?—A. Yes.

Q. So it follows from this way of thinking that it is not a formula but a check on our figures. The higher the remuneration earned by the doctors who are not in the Service, automatically the lower will be the remuneration given to the doctors who are in the Service. That follows?—A. Broadly speaking I think that might be the proper thing. Does it not follow that if the remuneration of doctors outside the Service is increasing they must be doing a greater proportion of work?

Q. Might they not be charging the bigger fees. How do you know about that?—A. I agree, but, generally speaking, they would be doing more of the work.

"A Ridiculous Position"

Q. Does it not strike you as a ridiculous position to say that the amount which has to be put into the pool for the remuneration of doctors in the Service is to be reduced if the remuneration earned by the doctors outside the Service is increased?—A. I am very sorry, I do not think I would agree.

Q. What method have you got of ascertaining the remuneration of doctors who are not in the Service?—A. All we have got is, as I have already explained, a certain calculation which was made this morning, and another calculation which appears in the supplement to the Ministry's case which assumes a certain measure of income from private practice. We are starting with the total income of all general practitioners before the war.

After some further questions Mr. Grant asked the witness to make an effort to answer the questions he was putting to him. What means had he got of ascertaining the earnings of doctors not in the N.H.S.? He replied that they had no real means of knowing that figure. They made certain estimations.

Q. I will leave that for now. Earlier you said that in various areas the total number of persons on doctors' lists exceeded the number of the population. Does that affect the amount paid into the pool?—A. No, it does not. All it does is to suggest that the number of people on doctors' lists is incorrect.

Q. There is obviously something wrong, but it does not affect the pool?—A. No, it does not affect the size of the pool.

Q. It might even suggest when you say that 5% of the population is not using the Service that that percentage is too high?—A. It is more likely that it is too low.

Q. That is guessing again, is it?—A. It is based on certain control figures which we have had.

Q. Have not the figures been got out?—A. They are being got out, but you appreciate it is a very big job and it is not done in five minutes, and I do not think the profession has been very co-operative about it.

Q. I gather that the reason why you scale up the £19m. is to give effect to the increased work necessary in the years during which the Service has operated?—A. Yes.

Q. That, therefore, is based on the assumption that the amount of work to be done will increase in proportion to the population?—A. That is not an unreasonable assumption.

Q. But everybody knows that it is wrong?—A. I do not know that it is wrong.

Q. You do not know that the work has increased to a far higher ratio?—A. I do not know that it has increased a great deal, but the Spens Committee has taken account of that in its recommendations. On the top of that you have a supplementary increase in the increase of the population.

Q. You are developing an argument about what you think the Spens Committee had in mind but did not say?—A. I am saying what they said in their report.

Increase of Work

Q. I will read it presently. You agree that the amount of work per patient has increased very much since the National

Health Service began?—A. It has increased, but I will not admit that it has increased very much.

Q. What proportion of the population was on the panel?—A. Rather less than 50%.

Q. May I give my figures for prescriptions? In the calendar year 1947, under the old National Health Insurance scheme 75,991,000 prescriptions were dispensed. In the half-year, January to June, 1948, 41,802,000 were dispensed, in the first half-year of the National Health Service, from July to December, 1948, the number was 90,334,000; for 1949 it was 219,188,000; for 1950, 236,650,000, and for 1951, 249,855,000. It does look like a substantial increase?—A. It is an increase, but it is a qualified increase in the sense that in the first set of figures you are looking at insured persons—namely, the working-classes—who have an incentive to stop at work, and who, by and large, are what might be called the healthier ranges of the population. Now that we have a National Health Service we have the young children and elderly people included. Therefore although there is a substantial increase it is not in proportion to the figures you read out. I would not take those figures by themselves as a measure of the increase in work.

Q. It is an increase in the number of prescriptions written out?—A. Perhaps the less one says about the number of prescriptions written out the better.

Q. Possibly that is so. You appreciate that the object of the Spens Committee, just before the scheme came into action, was to provide what should be a range of total professional income of registered medical practitioners in a publicly organized Service?—A. Yes.

Q. They laid down a scale which was converted into £16m., with an addition of £3m. which was necessary to furnish the remuneration for all individual doctors on the scale which the Spens Committee laid down as desirable on the 1939 basis?—A. Exactly.

Q. There have been changes, of course, but, according to your method of working it out, you start from the total and, in arriving at your result, the number of practitioners who are to be paid out of this fund is an irrelevant factor?—A. Certainly.

Q. Would you tell me how you can deduce anything which will produce a certain scale of remuneration which has no regard to the number of men in that class?—A. You are paying for a certain volume of work to be done. You have a certain number of people doing that work to whom you pay a certain amount of money. It does not make sense to me to say that you should have four men to do a job of work and pay them a certain amount because you want five men in a year's time.

Q. How can you arrive at a figure which will give a certain range of increase to a certain body of men if they pay no attention whatever to the number of men in that body?—A. I have already said that I would not agree that you would have to pay incomes of that range to a number of men.

Mr. Justice DANCKWERTS: Supposing that you had a certain amount of work for which you had four clerks, but you had to get a fifth clerk in order to do the work properly. Would you pay the five clerks the total that you have been paying the four clerks previously?—A. If it had been a Government office it would not happen because you would not get a fifth clerk.

Q. That is not relevant.—A. If one did have a fifth clerk one would probably have to bring in somebody of a very much lower grade. But you would not get five people to do the work which four could do in reasonable comfort.

Q. We are told that a certain standard wage or remuneration in the case of doctors is a proper figure. If you are going to pay the five clerks the total which you paid the four you are not paying enough.—A. If you have four people who are doing the job you are not going to pay five people to do the same kind of job, unless there is something seriously wrong in the organization of the office. In the case of general practitioners I would say that the Spens Committee does envisage an increase in the volume of work. So far as that increase in volume is concerned I would say it is an increase in population, and for that we make what we think is an adequate provision. But I am afraid I could not possibly assent to the theory that an unlimited number of people could come into it.

Mr. Justice DANCKWERTS: I did not say that; that is a different matter.

Full and Restricted Lists

Mr. Grant next asked the witness on what basis he had split up the amount paid to general practitioners on the full list and on the restricted list, respectively. He replied that it was an agreed basis. These figures were brought together

in his office and were checked against the names of doctors in their index. Their index showed whether the doctors were providing full service or had a restricted list.

Mr. GRANT: As regards consultants and senior medical officers, what are here indicated are, of course, part-time posts held by general practitioners?—A. Yes.

Q. When the Service came in general practitioners holding these posts were in the first instance continued in them?—A. That is so.

Q. But on the posts falling vacant has not the policy been to get these posts into the hands of doctors who were not general practitioners?—A. It is probably fair to say that there has been a tendency where such people were available to take the people into those posts.

In reply to further questions on this point the witness said that he was not concerned with the hospital side of the Ministry. The figures had been given to him by the Hospitals Division.

Q. So we are getting at the moment only "what the soldier said." Did you know that there is another document in September, 1951, saying that it is desirable to take action as soon as possible to reduce the number of senior registrars?—A. I know that is so.

Q. You have given no effect to this at all in the figures?—A. I have taken the figures given to me by the responsible division.

Q. I come to payments by local authorities. These are all estimates for the years in question. How do you say you arrived first of all at the apportionment of the total between payments made to general practitioners in the N.H.S. and to general practitioners outside the Service?—A. On exactly the same basis as for Government departments. I told you this morning that in respect of the major Government departments... we had a break-down between full-time and part-time doctors, and here we used the same ratio as for a Government department.

Q. What basis have you adopted for checking the split between the people with full lists and those with restricted lists?—A. We have not got it laid down at all yet.

Q. But you have given an all-round total of £367,000 as the amount allocated to Part III Services, and you have given an estimate of £5,000 of that to practitioners with restricted lists?—A. I am not sure at the moment what basis this is taken on.

Q. Do you think it is reasonable or likely to be right to apportion these Part III Services on this basis of Government department practice?—A. Well, I know of no other method of adjustment, because, by and large, it is the tendency for Government departments and local authorities to employ general practitioners. The general practitioner gets a reputation as the sort of man who is prepared to do this sort of job, and Government departments and local authorities do often employ the same man, so that I think it is not unreasonable to assume that the break-down is the same.

Q. Take the item "Care of mothers and young children"—that is, clinics. Is it not the fact that a very large proportion of these clinics are attended by women doctors, many of them married women, who are not in the N.H.S. at all?—A. That may be so in some cases, but I would not agree that it is completely so.

Q. It is not really very logical or sensible to apply to that kind of thing the basis thrown up by the experience of the Ministry of Labour and National Service, the Ministry of Pensions, or the Civil Service Commission?—A. All I say is that the break-down between Government departments is the only one we have. We have no other basis. And I suggest that, by and large, the method we have adopted is quite a reasonable one.

Q. It does not look, *prima facie*, very scientific?—A. I think it is as good as anything else. I would not be prepared to say there is anything very much wrong with that figure.

Q. Is not Part III (i) (Care of mothers and children) a diminishing item anyway?—A. There is a small diminution there, and midwifery has gone down a little, but overall there is an increase.

Coming to Government departments as another source of general-practitioner remuneration, Mr. Grant asked if there was not an actual break-down in the case of the Ministries of Pensions, Labour and National Service, and National Insurance, and the Civil Service Commission, and whether that break-down extended not only to health and non-health services but to restricted and unrestricted lists. The witness replied that it was a complete break-down.

Q. Is it not a fact that very substantial work in relation to the Service Ministries (War Office, Admiralty, and Air Ministry) is done by retired service doctors?—A. But they are men who

are practising general practitioners. These figures relate only to payments made to general practitioners.

Q. Are they practising to any extent as general practitioners with unrestricted lists?—A. We break these down on the basis of the others. There is no doubt that these gentlemen who hold themselves out to be general practitioners are general practitioners.

Q. Are they retired officers with unrestricted lists?—A. Some may have restricted and others unrestricted lists, but there is no reason to think that the great majority of them are ineffective practitioners.

Q. You just don't know?—A. I don't know definitely, but they must be assumed to be in effective practice.

Re-examination of Mr. Danielli

The ATTORNEY-GENERAL said that he wanted to understand—and he was being quite objective in this matter—the starting point on which the Spens figure was based which gave the £19.89m. representing the 1939 income of all doctors adjusted to give effect to the Spens increase. This, of course, included all doctors, whether inside the Health Service or outside, because in 1939 the National Health Service did not exist. When this figure was brought up to date by whatever betterment factor was adopted it still included all doctors, though not all were working in the National Health Service. Those not in the Service must be cut out, but those who were working in the N.H.S. would also be getting some remuneration from outside, and therefore in considering them it was necessary to include such outside remuneration.

The WITNESS agreed with this view. He explained that in computing these figures they did not start with the net income and then proceed to adjust it for practice expenses. The starting point was the gross income.

Asked to enlarge on his remark that he was not prepared to say on what basis in future he would proceed, the witness explained that what he had in mind was this, that after the present adjudication was over and the Adjudicator had given them the figure which he regarded as a proper one for the central pool, then that figure would be taken as the basis for the pool payments and would be adjusted to take account of changes in the population year by year and major changes in practice expenses, though that sort of thing could not be done every few months. Again, account would have to be taken of any future major change in the value of money. That was what he had in mind.

The ATTORNEY-GENERAL said that Mr. Grant had stated that in his view the Adjudicator would lay down a formula which would be generally applicable in the future. He gathered that the witness did not agree with that view.

The WITNESS said that he did not think it applicable to work on a formula. What they were aiming at was a net income which would be on the basis of Spens, with some adjustment to take account of any changes in the value of money and in the economic circumstances of other professions. If they got a total sum awarded by the Adjudicator that sum would have to be tabulated having regard to all other sources of remuneration. He would suggest that it was quite impossible to produce a formula which was going automatically to take care each year of what doctors might get from other sources. It was something to be looked at freshly every year. One could not say that the pool should be £50m. and should be adjusted every year to take account of an increase of population or an increase in practice expenses. He did not see how one could possibly devise anything in the way of a simple formula to take that into account.

The ATTORNEY-GENERAL: Have you been able to find the word "formula" in the terms of reference in this inquiry?

The WITNESS: It is not there at all.

Practice Expenses

Evidence was next given by Mr. L. G. K. STARKE, F.I.A., Principal Actuary in the office of the Government Actuary, with regard to practice expenses. Examined by Mr. GRAN-

VILLE SLACK, he said that in 1950, at the invitation of the Ministry of Health, he undertook an investigation into the practice expenses of general practitioners for the year ending March 31, 1950. It was agreed with the British Medical Association that an investigation should be undertaken for this purpose. A start was made with a sample of 3,145 principals in general medical practice in the National Health Service. The names were taken from the records in the possession of the Association. He thought they were selected by taking every sixth name on the list. The Board of Inland Revenue was then asked to furnish the returns from these doctors, particularly as relating to allowance for practice expenses. When the returns were made it was found that they were on a varying basis and for varying dates, with the result that a large number of the returns had to be discarded, and the number eventually taken was 449. From these 449 he made a calculation to find out the ratio of practice expenses to gross remuneration. The figure at which he arrived was 35.5%. The actuary for the British Medical Association arrived at the figure of 37.5%, and in order to reach a working compromise the Ministry had been prepared to concede a figure of 36.5%, but the British Medical Association refused to move from its higher figure.

Since then further information had been obtained about practice expenses, and this led him to suppose that his original figure of 36.5% was rather a bad guess. The second part of the story was the result given by an enlarged sample of some 700 doctors which had recently been forthcoming. This was an enlargement of the original 449. He proceeded to give the reasons which led him to take back his original figure of 36.5%. One of the reasons was that the sample on which it was based was disappointingly small; another important consideration was whether the sample could be deemed to be fully representative. In this case there was some ground for supposing that it was unrepresentative in a way which made the earlier figure an understatement. For example, the ratio which a doctor's expenses bore to his remuneration might vary somewhat according to the sort of doctor he was. A doctor in partnership might be supposed to incur a rather lower level of expenses than a single-handed doctor. A classification was accordingly adopted in which the cases were broken up into 36 groups. The result of his new calculations gave not a figure slightly in excess of 35.5% but one slightly less, actually 35.3%. He went through the same process of weighting the relative numbers and found a reduction of about 0.2%. In other words, his original 35.5% came down to 35.3%.

Asked how he arrived at 37.7% for the year ending March 31, 1951, he said that the Inland Revenue were able to study the 1950-1 returns for nearly 400 doctors who had figured in the 1949-50 returns, and the comparison between the expense ratios suggested an increase of 2.2% in the expense ratio, and this figure, he thought, was not at issue; it was accepted by both sides.

Cross-examination by Mr. Grant

Q. In the end there were 700-odd cases from which to draw a conclusion?—A. 725.

Q. The figure of 35.5% mentioned was based on that number?—A. Making a slightly different use of the figures brought the 35.5 down to 35.3.

Q. So that we get appreciably different results according to the use made of this very small sample?—A. Yes, if you call a difference of 0.2% appreciable.

Q. If you consider what it means in money I think it is quite substantial. At any rate there is this difference?—A. Yes.

Q. It does not look a terribly reliable figure, this 35.5%?—A. No. It was derived from a sample which was very much smaller than both sides hoped to achieve, but from the re-rating calculation it looks as though one cannot budge very much. I agree that 0.2% is appreciable.

Q. You are in a white sheet as regards the amounts you gave originally to the Ministry? You advised them to accept 36.5?—A. I do not know that I wear a very white sheet.

Q. But you are saying that your advice was all wrong?—A. Oh, yes, I made a bad guess.

Q. And I understand that you changed your mind about this because of what emerges from the difference arising out of the additional cases which brought the sample up from 449 to 725 ?
A. Yes, to the extent that the sample has been enlarged by these 200 or 300 cases. One is, I suppose, rather more confident over 725 than over 449.

Q. If your advice was sound on the material originally before you it does not become unsound because another 200 or 300 cases show approximately the same results as the original smaller number ?—**A.** I am afraid I must make it clear that the increase in the sample was not the only reason which led me to go back on my figure. It is this question of looking at the thing in different categories, and it brings one back to the question of whether the sample was representative. Did it represent in due proportion the different kinds of doctors ? It is common ground between the two sides that the original 449 might be suspect in that way. In arriving at the basis on which I gave my advice I had recourse to the only information then available to me in the shape of some figures the Ministry had collected for the first nine months of the National Health Service. These pushed up the 35.5 by a little. But shortly after that I was given a series of weights which were more suitable for the purpose in view. They related to the actual body of doctors with regard to whom the expense ratio would be used, and to the same financial year, and the effect was then to depress the figure slightly.

Q. It seems to be an elastic figure ?—**A.** Oh, yes, it is not cast-iron or even approximate. The trouble is that one has not sufficient information.

Q. If the 449 is not a reliable sample is there any ground for regarding the 700-odd as any more reliable ?—**A.** Well, I think I may say that if we had started off with 775 instead of 449 we should not have felt quite so unhappy.

Q. You would have been four-sevenths as unhappy. I notice that out of the original sample of 3,145 cases 2,775 forms were returned by the local inspectors, and of these 868 related to cases where accounts were not available. That is from the Inland Revenue, is it not ? And it means that the Inland Revenue did not have the figures as regards those 868 cases ?—**A.** That is as I understand it.

Q. One reason was that they had not agreed the figures with the taxpayer ?—**A.** Yes.

Q. Is it not reasonable to expect that *prima facie* the cases in which the Inland Revenue did not agree the figures were the cases where the taxpayers were making what the Revenue considered to be unduly large claims for deduction ?—**A.** That is possible.

Q. It is the most likely, is it not ? What other reason would there be why they should not have the figures ?—**A.** Well, I suppose some of us are more lazy in filling up our income-tax returns than others.

Q. But I do not think many of us are allowed to be as lazy as that. The inference to be drawn from these figures is that the 868 probably represent cases where high deductions were claimed for expenses, whether rightly or wrongly one does not know. The elimination of these 868 cases throws the average very much out and is likely to reduce the overall percentage ?—**A.** I can only agree with you that that is a possibility.

Q. Do you agree that the proportion of low income cases in what is left of the sample is unduly low ?—**A.** I would not know. My only way of testing is to find out whether the 35.5 as a straight arithmetical average by dividing one figure into another is the best one can do for applying to the whole body of doctors, and my method of testing that has been to use a series of weights derived from the whole body of doctors. The result of re-rating is that either the proportions in the categories are much the same throughout or that the error in one proportion is counter-balanced by the error in another.

Increases in Incomes of Other Professions

The ATTORNEY-GENERAL said that his learned friend, Mr. Grant, had questioned one of the previous witnesses concerning some information which he had derived from another Government department than the one with which he was associated. On the other hand, the whole of the evidence of Professor Allen was based on outside documents which he himself had not challenged. The next witness whom he was proposing to call had accumulated a mass of information from as many as 35 different sources. He hoped that Mr. Grant was not going to question each of these, otherwise the inquiry would be prolonged unduly.

Mr. Justice DANCKWERTS : The figures may be accepted even though the witness has obtained them from other sources.

Mr. J. P. DODDS, Under-Secretary for Finance, and Accountant-General, Ministry of Health, was examined by Mr. Granville Slack.

He produced a document in which information had been compiled as to the relative increases in income in other professions. He said that the information was collected in the autumn of last year. All of it related to the incomes of salaried people. He had endeavoured to get from professional organizations information as regards fee earnings, but without success. He had approached the Royal Institute of British Architects, the Law Society, and the Institute of Chartered Accountants, but he had not been able to get information regarding increases of fees.

Mr. Justice DANCKWERTS : Did you approach the General Council of the Bar ? (Laughter.)

The WITNESS : No, Sir. We approached the Law Society.

Mr. Justice DANCKWERTS : That is quite a different thing. You evidently did not.

The witness said in answer to Counsel that he had compiled a table showing the increase over 1939 which had taken place in July, 1948, September, 1949, and July, 1951, for certain specified professions. In the administrative class of the Civil Service, in the highest grades, the increases over 1939 at the three dates were respectively 15.8, 25.0, and 47.7 respectively, and the lowest 5.9, 13.6, and 25.0 respectively. The same process had been followed for other professions in the Civil Service, for Metropolitan magistrates, for officers in the Army, for officers of local authorities, for graduate teachers in grammar schools, university professors and lecturers, and Fellows of the Royal Institute of Chemistry, for the banking profession, for various industries and companies, and for whole-time hospital consultants in the National Health Service. Certain of the material from industries and companies was obtained in confidence, and the figures were handed up only to the Adjudicator and to the counsel on the other side.

He was asked whether the whole-time hospital consultants in the National Health Service had not been also the subject of an inquiry by a Spens Committee, and replied that that was so.

In reply to further questions, he said that it was impossible to carry out any averaging process for all of these miscellaneous grades, but in general it could be said that a perusal of the information showed that the general range of the increases was, for July, 1948, from 10% to 50% ; for September, 1949, from 10% to 60%, and for September, 1951, from 20% to 80%. The increases outside these ranges were few and exceptional. These figures covered by far the majority of the many instances which were included in the document.

Mr. GRANVILLE SLACK : In the Spens Report the view was taken that in 1939 doctors were underpaid ?—**A.** That is the view in the report.

Q. Are you aware of any other professions which took the same view ?—**A.** Yes, there are reports relating to several of these groups which did express the same view and I could go into details about them if desired.

The witness then went on to say that the case of the administrative class in the Civil Service was the subject of the Chorley Report published as a White Paper (7635) in 1949, and that was followed, after an interval, by an increase in salaries. The legal department of the Civil Service was the subject of a confidential report by a committee in 1944, which took very much the same view. The position of the scientific officers of the Civil Service was reported on in 1943, and again substantially the same view was taken. As regards teachers, the Report of the McNair Committee was published in April, 1944, and as regards university professors and lecturers, the University Grants Committee reported in 1947.

The examination of this witness had not concluded when the inquiry was adjourned until the following day.

THIRD DAY

Thursday, March 20

At the beginning of the sitting the evidence of Mr. R. E. BEALES, F.I.A., of the Inland Revenue, was taken *in camera*. Mr. Beales gave evidence as to the incomes of certain sections of professional classes.

Cross-examination of Mr. J. P. Dodds

Mr. GRANT, in cross-examining Mr. Dodds, who had given evidence on the previous day, said that what he had brought forward was a very small sample.

Mr. Dodds replied that it extended to several thousands of cases.

The argument then turned on the definition of "professional."

Q. All the cases you have given here are of people on salaries. You have not brought forward a single case of a professional man working as a principal?—A. No. The information I have submitted does not attempt to cover that field at all.

Q. A large proportion of your sample—for example, Civil Servants—are on salary scales?—A. Yes.

Q. If promotion is quicker than before the war, these figures take no account at all of that fact?—A. They are related to the same grades and level of responsibility as before the war.

Q. But if promotion is quicker than before the war these figures take no account of the influence of that fact on earnings?—A. No, they do not cover that at all.

The ATTORNEY-GENERAL: Do you know if promotion is quicker or slower now?—A. I am afraid I have no information on that.

Further Examination of Professor R. G. D. Allen

Professor ALLEN, who had given his principal evidence on the first day, then went into the box, and further questions were addressed to him by Mr. HYLTON-FOSTER on the evidence given *in camera* earlier that morning by Mr. Beales.

He said that the general impression he had got from listening to Mr. Beales's evidence was that it was not necessarily inconsistent with the general pattern he had tried to present in his own. Mr. Beales's figures had not surprised him, although he would have liked to have asked some questions about them before he reached a balanced judgment. One point concerned the timing. Mr. Beales had taken the year 1937 to begin with, and this was a specially good year. His own comparison was with 1938, and the difference as between the two years would be as much as 5%. Again, Mr. Beales's latest date was 1949, and here also the comparison was vitiated. He would have preferred to have a larger group for comparison than Mr. Beales had brought forward. The larger the group the greater the stability.

He did not wish to qualify in any way the evidence furnished in his own memorandum. Further, he thought that the assistance afforded by salary scales would be very limited. A person receiving a salary scale showed a different distribution of timing; in other words, salary proceeded by steps upwards until retirement, whereas for fee-earners a more typical distribution would be one which rose to a peak and then fell off. It would be dangerous to pick on one particular salary scale for comparison with the earnings which were not on a salary scale. He thought it true that at the present time other earnings increased far more than salary scales.

Mr. HYLTON-FOSTER: Speed in promotion is obviously of the greatest importance. Did you make an experiment on the basis of the documents available to you to see what happened to various individuals who were promoted, principally in the Ministry of Health, in certain years from 1927 to 1940?—A. I certainly found that those officials who had been made principals in the late 'thirties had reached by the present time higher posts in general than those who had been made principals in the late 'twenties—in other words, the later generation had gone ahead in comparison with the earlier. Even those appointed principals just before the war were further up the scale than those appointed in the late 'twenties. My general impression was that there had been at least four or five years' acceleration.

Q. Superannuation also comes in?—A. Yes, it must be taken into account. The different terms under which superannuation is obtained at the end of the salary scale are relevant because superannuation is in effect an increase of salary.

Further Cross-examination

The ATTORNEY-GENERAL addressed some questions to Professor Allen.

Q. Your 120% which you want to give to general practitioners to put them in the same position as a large number of professional and other people is a figure which is arrived at because there are people other than professional who have gone up by 120%, whereas professional men have not?—A. I did not imply that. Those who have gone ahead and also those who have fallen behind exist equally among salary earners and the other groups.

Q. Can you give an example of a range of professional men properly so-called whose remuneration has gone up 120%?—A. No, I could give you examples of the kind of people who may have gone up.

Q. Can you give an example of a profession which has gone up 120%?—A. That is too limited a question.

Q. It does not matter whether it is limited or not, the answer is "No"?—A. The answer is "No."

Q. You have heard evidence to-day [the evidence taken in closed court] relating to three professions in which the rise has been very much less?—A. I would not agree to that. The figures given in that evidence and in my own are not comparable.

Q. In 1938 and 1939, the years you have taken at the beginning of your computation, a large rearmament programme was getting under way?—A. No, sir, 1937 saw the beginning of that, and then there was a depression. The rearmament programme only affected incomes in the late 1939 and 1940.

Q. To say that 1937 was a substantially better year than 1938, unless we have some figures, is really just speculation?—A. It is general knowledge among economists that 1937 was a better year for industry and employment and for incomes generally than 1938.

Q. Would you say that as regards the legal profession?—A. No, I have no comment.

Some argument ensued on what constituted a professional man. Professor Allen said he had no evidence to show that in the case of men who worked on salaries their increase in net income as between the pre-war period and 1950 was smaller than that of men who worked on fees. The evidence was just not there. The question was a difficult one to answer precisely, because there was an overlap between the two. Salaried professional men in many cases also earned fees.

The ATTORNEY-GENERAL: What I am suggesting is this. It is quite clear from the information we have got that if you combined with the percentage increase in fee earnings of professional men the percentage increase of salaried professional men you would arrive at a substantially smaller percentage figure than that of the professional fee-earners only?—A. My information is that the two are broadly the same, and therefore the comparison figure of 120% applies to both.

Re-examination

Mr. GRANT, in re-examination, said that evidently Professor Allen attached less importance to salary scales than to earnings. Did salary scales give any clue to promotion or steps in the scale? Professor Allen replied that they did not. In reply to another question he said he had seen no evidence in this case at all to justify the opinion that non-professional people had "bumped-up" the percentage. His general conclusion was that upper salaried earners and professional earners had experienced very much the same kind of change since 1938.

Presentation of Case for the Ministers

The ATTORNEY-GENERAL then opened the case for the Ministers. At the outset he expressed on their behalf their appreciation of the extremely objective and very restrained way in which his learned friend, Mr. Grant, had opened the case for the Committee on the first day. One of the most

desirable results of this whole adjudication was that there should be a spirit of co-operation in which both parties could set to work on the next stage of this great National Health Scheme. They were all aware that in the past in connexion with this matter—and not surprisingly—there had been a certain amount of strong feeling, but his Lordship was now going to be in the position to give an adjudication which could be accepted by all concerned as the basis of future operations and would enable all these controversies to be put to rest.

Another thing which he ought to say was this: that this matter had been hanging about for a long time, and it was highly desirable that it should be settled now once for all. He was blaming no one at all, but so far as the Ministers were concerned it was their first determination when they came to office that they would get this matter concluded so far as possible.

The background was of some importance. He hoped he might be able to allay some feelings which had arisen based on misunderstandings as to their attitude in this matter. The adjudication had been decided upon because it was felt that there were two quite widely different points of view, and the proper way of settling the matter would be to have the case of both sides placed before an impartial adjudicator. Therefore if he had to put forward some matters which might appear to the other side harsh or unreasonable, after all, the matter was in his Lordship's hands. He thought he could say without any undue modesty—because he himself was not responsible for it—that the document put in summarizing the case for the Ministers did set out in sufficient fullness and fairness the history of the whole matter.

Mr. Justice DANCKWERTS: Yes, I found it of great help.

Thorniest Questions

THE ATTORNEY-GENERAL went on to say that it was from that history that the thorniest questions took their origin. The basis of the Spens Report was to arrive at what ought to be the proper individual incomes of medical practitioners, but actually what it did was to proceed from the point of total remuneration for all engaged in the work. The terms of reference of the Spens Committee were perhaps germane to this consideration. The Committee was instructed to consider what ought to be the range of total professional income of a registered medical practitioner in any publicly organized service of general medical practice; to consider this with due regard to what had been the normal financial expectations of general practice in the past, and to the desirability of maintaining in the future the proper social and economic status of general practice and its power to attract a suitable type of recruit to the profession.

The Committee at quite an early stage came to the conclusion that they could not go beyond the 1939 situation; they had not the necessary information, and they had to leave to be dealt with later the problem of adjusting 1939 values to post-war values. It was necessary to consider not only any change in the value of money but any change in the incomes of members of other professions. There one came up against one of the questions of principle involved in the present adjudication. His Lordship had been asked to do two things—first, to take into account the increases in cost of living, and, secondly, the increases which had in fact taken place in incomes of other professions, and to apply whichever figure was the greater.

He had to submit to his Lordship that that was quite a misconceived approach. Let it be supposed that the cost of living increased by 300%, but that the incomes in other professions had not made anything like a similar increase. Would it not be an extraordinary proposition that doctors should be given the 300% increase? That would be a thing which, he was quite sure, the doctors themselves would not suggest. Therefore it must be the case that the controlling factor was the corresponding change which had taken place in the incomes of other professions. If other professions had not caught up with the rise in the cost of living it would be an extraordinary proposition that doctors alone

should be given preferential treatment. His learned friend's argument on that point was unreal, because it must result in absurd and unfair consequences.

Incomes in Other Professions

In fact it did appear to be the case that professional incomes had not caught up with the cost of living. Obviously the increase in the cost of living was one of the factors which had to be taken into account, but it seemed evident that what doctors should be given should be comparable with what other professions obtained, and if there had been an increase in other comparable professions a corresponding increase should be received by them.

How was one going to say what was the position with regard to other professions? It would be agreed that this was an extremely difficult field in which to travel, and he was sure his learned friend would not suggest that on their side they had not done their best to assist his Lordship in the matter. After all, statistics of the kind required in this case were almost impossible to obtain. Efforts had been made to obtain figures from certain professional bodies, but those efforts had largely failed. It was doubtful whether the professional bodies in question had got them or had got them in any more than an extremely imperfect form. Professor Allen, the first witness called on the side of the Committee, was not overstating the matter when he said he was proceeding, with certain basic figures, on speculation. That morning he himself had tendered other evidence on that point—the evidence of Mr. Beales.

Mr. Justice DANCKWERTS: Mr. Beales's evidence was very helpful indeed.

THE ATTORNEY-GENERAL went on to say that the next matter was in relation to the number of doctors. He would like to consider in an entirely objective way how controversy had been built up over that. The whole basis of this inquiry concerned total remuneration. There was a certain amount of public money available for the purpose of the National Health Service. Quite obviously those responsible for its guardianship were jealous over its administration. It seemed extraordinarily difficult to determine how many doctors there were in this service at any given moment. The figure of 19,227 general practitioners given in the Committee's case included some practitioners who were not engaged in providing general medical services throughout the year. If those were excluded the number of general practitioners for the year ending March 31, 1951, became 18,387. This illustrated the difficulty of arriving at a proper estimate of the number of practitioners providing the services.

The basic question which did arise was this: the view had been taken throughout the whole discussion that the proper way to approach this method of payment was on the basis of work done. His Lordship might come to the conclusion that that was wrong; there had been a great deal of discussion about it. His Lordship had not been troubled by his learned friend concerning the various arguments which had arisen on that head, and he might very well ask himself, having added on the Spens increase of £3.1m., whether the work could be done by the same number of doctors under the National Health Service. It was not part of his instructions to allege over-doctoring. They knew that doctors were hard worked. There might be certain areas where there was over-doctoring and others where there was under-doctoring, but no evidence had been given on that point; nor was he attempting to bring forward evidence that there was over-doctoring.

The Attorney-General then proceeded to deal in detail with remuneration which general practitioners in the National Health Service received outside the Service. He said that, like many parts of this inquiry, this involved various estimates and approximations.

He continued: "I say what has throughout been stated on behalf of the Department, that the Ministers, rightly or wrongly, arrived in 1947 at a certain figure for the central pool. The Committee considered that figure too small, and

the Committee are suggesting that a positive addition should be made to the central pool. We say that it is for the Committee to prove that this addition should be made, and it is for your Lordship to decide whether they have made out their case or not."

What in all the circumstances was the comparable increase in other similar professions? The only way in which that could be tested was by asking in the first place what was the meaning of the expression "other professions." Reference had been made to the various new professions which were springing up, such as he had described at one stage as the "Burnham world"—the industrial and managerial type of occupation—and he thought his Lordship would agree that it was not intended that professions of that kind should be included. On the other hand, the professions did clearly include not only the men who worked on their own account for fees but those who worked for salaries as professional men. There was not much difference of view between Professor Allen and Mr. Beales on this point. If the Committee could satisfy his Lordship that there ought to be a percentage increase, let it be so. But could it really be said that they had satisfied them with any evidence which would justify a figure of more than 80% increase in comparable professions?

Difficult Territory

The Attorney-General made certain submissions. After some argument on the relatively minor calculations made in the opposing cases, he addressed himself to the comparison with the increase in earnings in other professions. What was meant by "professions" in the terms of reference of the present inquiry? It was certainly not intended that the Adjudicator should take into account people who were not in the professions as the word had been understood for hundreds of years. It had almost been suggested by Professor Allen that farmers should be included among the professions.

But "profession" in the sense in which the term was used in the terms of reference certainly included both salaried people and self-employed people who earned fees. As regards the latter, evidence had been given that morning (by Mr. Beales). He did not know what was the numerical relation of these two groups of professional people, but he would suggest that there were many more salaried than fee-earning. The Ministry had tried to get some scale which would show the increase which had taken place in professional salaries during the period in question (1938 to 1950), and it did appear that in the case of professional salaries the increase had been less than in the case of fee-earners. It was common knowledge that the professional man working on salary did get a rather poor deal as compared with other people.

The best conclusion that one could suggest was this: that if one were able to amalgamate the salaried and the fee-earning professional people one would have to proceed on the basis: (1) that there were more salaried people than fee-earning, and (2) that on the whole salaried people received less than fee-earners. Professor Allen was working on difficult territory, but he was not dealing at all with the problems his Lordship had to cover. In the Committee's case it was stated that it was possible to determine with reasonable accuracy the general level of net professional incomes per head, as compared with their general level per head before the war. But Professor Allen had made no attempt to do this. He had not proved that professional incomes had advanced by 120% (in other words, if the figure for 1938 were taken as 100, then the figure for 1950 would be 220). All he had done was to show this percentage increase for the whole group of earners. It was true that that morning, in reply to a question put to him, he seemed to say that they would all stand at 220, but he thought he had told them previously that with the inclusion of farmers and other people one would expect to find the professional man relatively rather down in the scale. The argument

seemed to be, "It is quite true that salaried and fee-earning professional people have not been able to get up to 220 (in relation to the 100 for 1938), but because the general income class to which they belong has been raised to that figure, they should be raised to it also." But it was not to this point that the terms of reference were directed. The Committee's case mentioned the general level of net professional incomes per head as compared with the pre-war position. It was quite clear that this was much lower than 220, and that some figure substantially smaller than that would have to be taken. It was imputing no blame to Professor Allen to say that he was not really very helpful on that point.

Cost of Living Up

The restoration of the doctor to his place in the hierarchy of professional incomes had been mentioned. It was said that he must be at the same distance from the top of the scale as he was before. He had been tempted to ask, "Why not have him the same distance from the bottom? One got into all sorts of difficulties in exploring these unknown statistical territories. The terms of reference of the Spens Committee were to consider what ought to be the range of total professional income of a practitioner in a publicly organized service, with due regard to what had been the normal expectations of general medical practice in the past and the desirability of maintaining in the future the proper social and economic status of general medical practice. It was not a question of what terms were necessary to keep up with the cost of living. The mere fact that the cost of living had gone up was no reason in itself for giving the doctors a better deal than anyone else. All that Professor Allen had proved was that, owing to the very skilful efforts of certain sections of the population included in his enumeration, on the average the people in those sections had caught up with the cost of living whereas the professional man had not.

It had been suggested by his learned friend Mr. Grant that his Lordship should consider making a formula. He begged his Lordship not to consider doing so. It did not fall within the terms of reference of the inquiry. He also pointed out that the safeguard against new people setting up in the practice of medicine was very slight, so that any suggestion that the Adjudicator should lay down a sort of principle whereby the number of doctors might be taken at a given date and multiplied by a certain figure would be a very dangerous thing to do. The Ministers did not agree that by reason of Section 34 of the Act there were adequate safeguards against "over-doctoring," or that there was not, or could not be, a surplus of general practitioners in the Service. The Medical Practices Committee could prevent further practitioners entering the Service as single-handed practitioners in areas where it was established that there were already enough, but it could not direct a practitioner to remove from an "over-doctored" to an "under-doctored" area.

He concluded by saying that the attitude of the Ministers was that if the General Medical Services Committee was able to satisfy his Lordship that the pool was inadequate, well and good, but they submitted that on the evidence brought forward no sufficient grounds had been shown for increasing it in the manner suggested by the Committee.

Mr. GRANT explained that all that he had meant by the word "formula" was that his Lordship in giving a figure for 1950-1 should also furnish them with some idea how he had arrived at it.

Mr. Justice DANCKWERTS said that, as he understood it, the Committee contended that there should be adjustment back to July, 1948. For that reason he would have to indicate how he reached his particular figure, and might have to indicate what would be an appropriate factor.

Final Speech for G.M.S. Committee

Mr. GRANT, in his final speech for the Committee, took up first the amount of betterment percentage. He was not quite

sure what the attitude of his learned friend the Attorney-General was about the comparisons which had been brought forward. Reference had been made to the fact that in the income groups Professor Allen had brought forward he had included the incomes of persons such as farmers.

Mr. Justice DANCKWERTS: The farmers go out of consideration; they are not traders, nor are they professional people.

Mr. GRANT addressed himself to the question of what was relevant in fixing the betterment percentage. One had to compare what had happened to doctors with what had happened to members of other professions, and his friend suggested that if these changes had not kept pace with the changes in the value of money, that was just too bad. In the Spens report (para. 6) it was stated:

"We leave to others the problem of the necessary adjustment to present conditions, but we would observe in this connexion that such adjustment should have direct regard not only to estimates of the change in the value of money but to the increases which have in fact taken place since 1939 in incomes in other professions. In our judgment it is only if corresponding changes are made in the incomes of general practitioners that the recruitment and status of their profession will be maintained as against these professions."

The Spens Committee had also laid stress on the difficulty of recruiting doctors:

"We consider that unless conditions are substantially improved in both these respects [that the percentages of low incomes were too high and that the proportion of practitioners able to reach the stated net income was too low], and on the basis of a pre-war value of money, the social and economic status and the recruitment of general medical practice could not, in the long run, be maintained."

It had been argued that it was wrong to take the higher of the two figures—the increase in the cost of living and the increase in the remuneration of other professions, and a picture had been painted of the cost of living advancing by 300% and the increase in professional earnings being only 100%; and of the anomalous position of doctors if on their behalf the higher figure were accepted. He submitted that on a proper construction of the Spens report one should take the higher of the two figures for this purpose, but in fact the figures for the two calculations were not very different. He claimed that there was no justification for so low a percentage increase as 80. The evidence for the Ministers was given on this point by Mr. Dodds. It consisted largely of salary scales which by themselves were useless for this purpose. For one thing, the conclusions were vitiated by the fact of salary promotion. Mr. Beales had produced figures showing on the basis of Schedule E assessments that in the professional groups he had indicated the increases, comparing the year 1938-9 with the years 1949-50 and 1950-1, were 88% and 89½% respectively. Adjustment had to be made for increased depreciation allowance, but this was a small sum. But in effect Mr. Beales's comparison, taking the assessments for 1938-9, were on the basis of earnings in 1937, which was a better year than the years following. Therefore his base figure was too high, and similar considerations applied to his closing figure, which was too low. The figures were not for the right years at either end, and therefore the conclusion to be drawn even from Mr. Beales's evidence was that the percentage increases in this group were appreciably higher than his 88 and 89½%.

There was no evidence that Professor Allen had "bumped up" his percentage by including non-professional people, and he suggested that his evidence had not really been seriously challenged. There was also a question whether the betterment percentage should be applied to the £16.79m., which was the net pre-war income of 17,900 principals in general practice, or to the £19.89m., which included the addition of £3.1m., being the increase required to give effect to the Spens recommendation that the proportion of practitioners able to reach in 1936-8 a net income of £1,300 or over was too low. The only ground on which it had been faintly suggested that it might be applied to the £16.79m.

was that other professions might have been underpaid in 1939, but the evidence as to such underpayment was negligible.

The next question was that of scaling up. The Committee had scaled up the figure by reference to the number of doctors serving in the National Health Service with unrestricted lists. This figure—19,227—had not been challenged.

Mr. Justice DANCKWERTS: A criticism was made that this number were not necessarily serving during the whole of the year.

Mr. GRANT said that the figure was taken as at March 31, 1950, and at December 31, 1951, and it was assumed that the increase which had taken place between those dates was evenly spread over the period. The figures were those of the Ministry, and all that the Committee had done was to assume an even spread over 21 months. His learned friend had scaled up by reference to population. That was only the beginning of the trouble. Mr. Danielli, the Ministry's chief witness, had agreed that it was relevant to take off 5% for the people who were not using the N.H.S., but no reference had been made to that in the Attorney-General's computations. If they scaled up by reference to population they were in fact proceeding to work on a basis which completely ignored the number of doctors, and were not dealing effectively with the Spens recommendations at all. With conditions as they were, the Spens basis was not only the right basis but the basis which had to be applied. To scale up by population and to ignore the number of doctors was simply not to do what the terms of reference required. It was not open to his Lordship to treat the matter in any other way than the scaling up on the number of doctors in the Service. The Ministry's method took cognizance of doctors outside the scheme. It was ridiculous to say that the amount of fees to be paid to the doctors in the Service was to vary inversely with the fees collected by doctors outside the Service. It meant bringing into calculation an entirely unknown item—namely, the remuneration of the doctors outside the scheme.

The Committee scaled up the figure first of all by reference to the number of doctors. They were setting out to provide for the remuneration of the doctors in full service. Admittedly they had to give credit for what the doctors received outside the Service.

He dealt next with the expenses percentage (38.7% for the year to March 31, 1951). His Lordship had the evidence on that. The Inland Revenue were given a sample list of 3,145 principals in the Service, and an endeavour was made to get their taxation figures. Most of them dropped out, and they ended with a list of 449, from which a percentage of 35.5 was deduced as the expense ratio. Mr. Stark had advised the Ministry to go as high as 36.5%.

Mr. Justice DANCKWERTS: He said he had made a bad guess.

Mr. GRANT said that in point of fact, when the position was examined, it was very far from evident that he was wrong the first time. One of the matters which Mr. Stark said influenced him was that it was not clear that the effect of arrears payments had been entirely eliminated. The fact that in a large number of cases in the original sample the figures were not available because the assessments had not been agreed with the taxing authorities suggested that such cases in the main were those in which the doctors were arguing with the authorities about their allowance, and probably those which remained would tend to be those on the low side. Taking the figure of 36.5%, and adding to it the 2.2% to adjust it to March 31, 1951, they had the figure of 38.7%, applied to the figure of £47.876m., being the estimated gross receipts for all principals in the N.H.S. for the year ending March, 1951, excluding those with restricted lists. The Ministry's figure was 37.7%.

The Inducement Fund was not a matter of figures but of principle. It depended upon what the Spens addition of £3.1m. covered. In the first recommendation of the Spens Committee no figure was given at all. In his submission this was intended to be outside the scale laid down in that

and the following recommendation. No statistician working on the Spens report could give effect to it, because there were no statistics.

Mr. Grant had not concluded his speech when the Adjudicator rose for the day.

FOURTH DAY

Friday, March 21

Final Speech for G.M.S. Committee

On the last day of the Adjudication the proceedings lasted little more than half an hour.

Mr. FREDERICK GRANT concluded his final speech on behalf of the General Medical Services Committee. He dealt with certain revisions which, he said, ought to be made in the estimates of the remuneration of general practitioners for 1950-1 from public sources under Part II (hospital services) and Part III (local authority services). He gave reasons why, for the purpose of computation, reductions ought to be made in these estimates. The same applied to many of the services rendered to other Government departments. For example, probably a large part of the work for the War Office, Admiralty, and Air Ministry was carried out by retired Service doctors who had not full lists. All these services should be subject to some discount, as set out in the Ministry's computations.¹ They were not very large items, but it was not safe to take in full the figures as presented by the Ministry.

There remained the item for private practice. According to the Ministry's case, on the data available it was assumed that the average net income received by general practitioners in the Service as a result of private practice and of payments by local authorities for services other than those under Part III was of the order of £4,334m. According to figures worked out by the General Medical Services Committee the amount should be £1m. The Ministry had put in the same figure for each of the years under review. The figure was derived from an Inland Revenue investigation primarily undertaken for deciding the ratio of practice expenses to gross income. A fairly large sample was taken, but many eliminations were made; and it came down eventually to 449 cases, afterwards increased to 761. The figures for this relatively small number revealed an average total remuneration from all sources, inside and outside the Service, of £1,681. The figure with which this was compared was one extracted by the Ministry as giving the remuneration from other than private sources for all doctors in the Service. Thus one of these estimations represented the total remuneration of a small number (700-odd) and the other the remuneration, apart from private practice, of the entire profession (18,000-odd). If the two groups had been comparable there would be something to be said for this method, but of course the one group was extremely attenuated; and the assumption was made that the general level in that small number was the same as in the grand total. There was no evidence to support that assumption at all. The figure worked out at between £100 and £200, and Mr. Danielli had told the Adjudicator that he had fixed on £150. The figure ought to be heavily discounted. There was no sufficient evidence on which to build so important a figure. He must leave it to his Lordship to decide what the discount should be, but it should be subject to a heavy discount for the first year and a still heavier one for the later years.

On the matter of compensation interest, in his submission this was not remuneration: it was a statutory payment covered by Section 36 of the Act. It arose from the prohibition upon the sale of goodwill of practices, and had no connexion with Spens in any shape or form. It was described in the statute as compensation for deprivation of a capital asset.

Returning to the question of the betterment factor, particularly with regard to the evidence of Mr. Beales, Mr. Grant

¹The Ministry's estimates of remuneration of general practitioners for Part II services, 1951-2, were £2,055,000; for Part III services, £367,000; and for services for other Government departments, £668,000.

said that in his comparison Mr. Beales had taken a pre-war year (approximately the calendar year 1937, which was the basis of the assessment for the 1938-9 returns) and the calendar year 1949, and had shown that the increase in professional incomes had been 88 or 89%, subject to a small deduction in respect of depreciation. Mr. Beales had agreed with him that 1937 was a better year than 1938 or 1939, and Professor Allen had said the same thing. The 100 figure which had been taken for the basic year 1937 would be less than 100 if the year 1939 had been taken, and the figure 189½ which had been taken for 1949 would have been higher had 1950 or 1951 been taken. This was arithmetic and nothing else. If one assumed that there was a 5% drop as between 1937 and 1939 and a 5% increase as between 1949 and 1950 or 1951, the 100 for the first year would become 95, and the 189½ for the last year would become 199. This made the increase in terms of percentages 110. He submitted that Professor Allen's figures were unshaken.

Of the amount in the pool—namely, £41,533m.—8% under the superannuation provisions, which were based on Section 67 of the Act and on certain regulations, had to be paid out of the Exchequer as representing the Government contribution to the Superannuation Fund. If his Lordship increased that £41,533m. to a higher figure it might be on the assumption that no superannuation payments had to be made on the additional amount, but that a suitable adjustment should be made to provide for them. This contribution was provided out of Exchequer moneys which were separate from the central pool. Although it was counted as part of the practitioner's remuneration, it was not in fact paid to him but was set aside for the purpose of providing superannuation benefits. It did not, therefore, form part of the practitioner's actual receipts.

Mr. SLACK: We can work that out arithmetically afterwards.

This concluded the submissions on both sides, and Mr. Justice DANCKWERTS said that he would send a copy of his determination to both parties, and he did not expect to keep them waiting very long.

The inquiry then terminated.

SHILLING ON PRESCRIPTIONS

MINISTER TOLD OF DISPENSING DOCTORS

Representatives of the doctors and pharmacists had a two-hour meeting with Mr. Crookshank, the Minister of Health, on March 20, to discuss the shilling on prescriptions. The Minister's attention was drawn to the difficulties confronting dispensing doctors in collecting the charge.

A meeting between the doctors' representatives and Ministry of Health officials was held on March 25.

The Bill had its second reading in Parliament on March 27, after we went to press.

PRESCRIPTION COSTS INCREASE

Because of higher wholesale prices of certain drugs and appliances, the following increases per prescription will be made on the average cost per prescription: 2d. for under 2s. 10d.; 3d. for 2s. 10d. to 3s. 11d.; 4d. for 3s. 11d. to 5s.; 5d. for 5s. to 6s. 2d.; 6d. for 6s. 2d. and over. Quarterly payments on account to dispensing doctors paid in accordance with the Drug Tariff will be adjusted similarly.

ANNUAL CONFERENCE OF LOCAL MEDICAL COMMITTEES

The Annual Conference of Representatives of Local Medical Committees will be held at B.M.A. House, London, on Thursday, June 12, at 10 a.m.

OCCUPATIONAL HEALTH

A meeting of the Occupational Health Committee of the Association was held on March 19 under the chairmanship of Dr. J. A. L. VAUGHAN JONES.

National Coal Board: Scale for Part-time Medical Officers

The Committee discussed the National Coal Board's recommendation regarding the remuneration for medical officers in part-time contract with the Board. The chairman commented upon the good relations obtaining between the Association and the Board, and it was agreed that the scale, which is in conformity with the Association's scale, be accepted.

The Dale Report

It was reported that a letter had been received from the Ministry of Labour and National Service, in reply to an inquiry, stating that with regard to para. 75 of the Dale Report there had not been found to be such lack of co-ordination as to justify the setting up of an advisory committee. The Dale Committee had recommended that a standing joint advisory committee, with a strong medical membership, and with representatives of Government departments, employers, and workers, should be an essential part of new developments. In discussion it was pointed out that any co-ordination which did exist appeared to be only at local level, and that there was an undoubted lack of co-ordination at the centre. Further, inasmuch as the Dale Report recommended that this advisory committee should be charged with the development as well as the co-ordination of industrial health services, it was resolved to ask whether the Ministry's reply meant that no action was being taken with regard to developments within the industrial health service.

The Ministry's letter also referred to the position of the appointed factory doctor in relation to the school medical officer. The view of the Ministry was that there was no overlapping, and that the question of co-operation arose only in respect of the furnishing by the school medical officer to the factory doctor, where required, of information on the previous medical history of the young person, a matter already provided for under the Factories Act, 1937. One member of the Committee suggested that a shortened form of school medical record might be transferred to the factory medical record. The general practitioner's position in respect to this was referred to, and it was pointed out that, whilst there was a statutory obligation on the education department to make the records available to the appointed factory doctor, there was no similar compulsion on the general practitioner.

Some members thought that it was a waste of medical manpower to have, both a school-leaving examination and a pre-employment examination in industry, but other members stressed the advantages of maintaining the two examinations. This matter was deferred for further discussion at the next meeting.

Occupational Dermatitis

The question of occupational dermatitis, which has been discussed at several previous meetings of the Committee, again arose following upon correspondence with the Ministry of National Insurance. The CHAIRMAN said that the question of obtaining statistics in relation to occupational dermatitis had been pressed without success. On the suggestion that all cases persisting after 21 days should automatically be referred to a dermatologist, the Ministry was of the opinion that there were not sufficient dermatologists available at the present time to deal with the automatic reference of such cases. The Ministry also felt that the work entailed in sending copies of the dermatologists' reports to the examining practitioner concerned would hardly be justified. The Committee decided to seek the views of the Association of Factory Surgeons.

Another matter which concerned the Ministry of National Insurance was the constitution of medical appeal tribunals. It was stated that the Ministry had decided that members of such tribunals must be senior members of hospital medical staffs. The Committee decided to transmit its firm opinion that experienced industrial medical officers should be recognized for membership.

Tripartite Consultations

A letter was read from the Southampton and District Advisory Council on Occupational Health suggesting the establishment of a central liaison with employers. This suggestion led to a certain amount of discussion. It was thought that it was inopportune to propose the immediate establishment of a tripartite body, although it was appreciated that an increasing number of local advisory councils on occupational health were being formed on a tripartite basis. It was felt, however, that a joint committee with employers would be extremely helpful, and it was agreed to recommend to the Council of the Association that a further attempt be made to establish a joint committee with the British Employers' Confederation.

THE MIDDLE EAST BRANCH MEETING AT BAGDAD

A very successful Annual General Meeting of the Middle East Branch of the B.M.A. was held at Bagdad on March 4 and 5. The British Ambassador, Sir JOHN TROUTBECK, opened the proceedings with a felicitous speech in which he reminded his large audience that Bagdad was once the centre of the medical world and "those who are Scotsmen among you may think that it might still be so to-day if its place had not been usurped by Edinburgh." Sir John stated that the whole world was groping towards international co-operation and there were few fields in which such co-operation was already more effectively at work than the field of medicine. The medical profession in Iraq had been built up in the closest association with the British, and the growing international importance of the Iraqi medical profession and of the Royal Medical College was clearly evident.

The Ambassador was followed by H.E. the Minister for Social Affairs, SAYYID MAJED MUSTAPHA, and by the Dean of the Medical Faculty, Professor HASHIM AL-WITRY.

The scientific proceedings then opened with a lecture by Professor F. A. R. STAMMERS, of Birmingham, on "Fluid Crystalloid and Protein Balance in Surgery," which was much appreciated. Dr. F. AKRAWI, professor of venereology at Bagdad, read an interesting paper on bejel, a treponemal disease resembling syphilis and endemic in certain countries of the Middle East. Professor Akrawi considered that bejel was syphilis modified by the conditions under which it existed.

A lecture on W.H.O. in the Middle East was delivered by Dr. W. H. CRICHTON, the public health administrator for the Eastern Mediterranean Regional Office of W.H.O. The lecture was followed by an interesting discussion in which Dr. W. H. FORD ROBERTSON (Beirut) suggested that insufficient attention had been devoted to mental health in the Middle East and hoped that in the future this would be remedied. Professor A. M. CRITCHLEY (Bagdad), who, as Honorary Secretary of the Middle East Branch, B.M.A., was responsible for organizing the meeting, welcomed W.H.O. as mankind's biggest effort in the battle against disease, but felt that the W.H.O. services for acquiring and imparting information could be improved.

Professor STAMMERS toured the surgical wards of the Royal Hospital and gave a second lecture. Medical films were shown and there was a medical exhibition. Social functions included a luncheon given by the Minister for Social Affairs, the Annual Dinner of the Middle East Branch, and an excursion to Babylon.

The meeting was attended by a large number of doctors from as far afield as Bahrein and the Lebanon.

DISTRIBUTION OF G.P.s' PAY

THE WORKING PARTY

When adjudication was agreed last year the General Medical Services Committee also agreed to set up with the Ministry of Health a joint Working Party to examine distribution of general practitioners' remuneration.

The proposal was first suggested by the Minister of Health and the Secretary of State for Scotland (*Supplement*, August 11, 1951, p. 56). They wanted a Working Party "to work out a revised plan of distribution" designed to secure certain objects. Discussions with G.M.S. Committee representatives followed, and the finally agreed terms of reference of the Working Party were as follows:

Terms of Reference

"To secure an equitable distribution of the central pool based upon the recommendations of the Spens Committee, the object being to enable the best possible medical service to be available to the public, and to safeguard the standard of medical service by discouraging unduly large lists; at the same time, to bring about a relative improvement in the position of those practitioners least favourably placed under the present plan of distribution, to make it easier for new doctors to enter practice, and to stimulate group practice."

Make Happier Atmosphere

Meanwhile, in accepting the Working Party proposal, the Committee had assured the Ministers that it would be the aim of its representatives on the Working Party to work harmoniously with a desire to provide the best possible service for the public and make possible a better and happier atmosphere among the doctors who take part in it. But the Committee pointed out that "the profession would feel rightly aggrieved if the award following arbitration were nullified by failure to agree in the Working Party upon the proper distribution of the pool."

The Committee appointed as its members on the Working Party the following representatives:

Drs. S. Wand, A. T. Rogers, W. M. Knox, E. A. Gregg, C. F. R. Killick, A. Campbell, H. Guy Dain, A. B. Davies, F. Gray, J. T. Baldwin, J. Bleakley, J. T. McCutcheon, D. P. Stevenson.

The first meeting of the Working Party was held on February 26, when the Committee representatives went with certain proposals to discuss with the Ministry. These proposals are now being considered by the Ministry, and more meetings will be held. The meetings are confidential, but news of the discussions will be given as soon as it is released.

Possible Arbitration if Disagreement

The Committee received an undertaking that the findings of the adjudicator would be made known before the Working Party had concluded its deliberations. Further, if there is disagreement in the Working Party, then the question of arbitration on the points of disagreement is not ruled out.

THE DURHAM DISPUTE

INVITATION TO PROFESSIONS' REPRESENTATIVES

Durham County Council has invited representatives of the Joint Emergency Committee of the Professions to discuss the "closed shop." This is in response to a request from that committee to send a deputation (*Supplement*, March 22, p. 108). The committee has on it representatives of the doctors, dentists, nurses, midwives, teachers, and engineers.

The committee had not considered the invitation before we went to press.

Heard in Chancery Court III

One Hundred Thousand Words

Such was the extent of the speaking, spread over 14 hours, which was required to present and to contest the General Medical Services Committee's case before the Adjudicator. The shortness of the inquiry was a surprise to almost everybody. The general notion had been that it would last for 10 or 11 days. It lasted three days and one hour—a shorter time than the similar inquiry in 1937, which went on for four very long days, and the one in 1924, which went on for five days. But in fact no one knew how the case would develop, what contests on figures would arise, and what witnesses in reserve it might be necessary to call. The Committee had in reserve a financial expert of national reputation, a distinguished actuary, and medical practitioners in the Service. But no witness who was a doctor or had any connexion with medical practice was called on either side, and the statisticians and economists, the actuaries and accountants had it all their own way. The pre-war inquiries were concerned with arguments over shillings and pence, but this time no cognizance was taken of figures other than millions and decimal fractions thereof. In the two earlier courts the doctor himself, his budget, his transport, his way of conducting his practice, figured prominently. In his place was now a shadowy, balloon-like thing called the central pool.

Human Interest

A press reporter complained to us that the proceedings had no human interest. Certainly they were dull. It requires more than the spells cast by an Attorney-General and two other Queen's Counsel to give life to figures, especially when they are distended to millions. There had been some fear that the court would be too small for those who wished to attend the proceedings, but everybody was well accommodated. A few resolute executives of the Association and the Chairman and Secretary of the General Medical Services Committee sat it through, as did certain chiefs of the Ministry of Health, including a deputy chief medical officer. Various members of the profession looked in from time to time and then staggered out under the weight of figures. Others peeped through the glass panels but probably were deterred by what in Bleak House is called the owl aspect of a Court of Chancery. One morning the whole of the public gallery was occupied with schoolgirls acquainting themselves with legal—in this case quasi-legal—procedure. It must have been a disappointment to them to find that neither his Lordship on the bench nor the learned gentlemen addressing him wore wigs and gowns. One hopes that they were able to understand one word in ten and one figure in a hundred.

Skilled Advocacy

A special tribute should be paid to Mr. Frederick Grant, Q.C., who, coming into the case at short notice, handled it in a masterly manner, as though he had been doing these very calculations all his life. His cross-examination of the Deputy Accountant-General of the Ministry on the constitution of the central pool was a fine forensic display, and indeed was the high-spot of the proceedings. He was ably assisted by Mr. Hylton-Foster, Q.C., and, in a non-speaking but none the less industrious part, by the junior counsel, Mr. S. B. R. Cooke. The services of Mr. Leigh Taylor, of Hempsons, in the preparation and conduct of the case were, of course, invaluable. Mr. Justice Danckwerts, presiding as Adjudicator, once or twice permitted himself a touch of judicial humour, as when he asked a witness who had been applying to various professional bodies to ascertain what increases had taken place in the earnings of professional men who worked for fees, "Did you apply to the-

General Council of the Bar?" The witness replied that he had asked the Law Society, upon which his Lordship shook his head, "Ah, that's quite another thing." One saw in Chancery Court III an exhibition at its best of the British way of settling a dispute. But as the chairman of the General Medical Services Committee remarked when he came into court on the first day, "What a pity that these two parties, both interested in the health of the people, are on opposite sides!"

SUPERANNUATION

MEDICAL SCHOOLS AND M.R.C.

Members of hospital medical staffs who, within twelve months of leaving superannuable employment in the Health Service (or within six months of completing National Service if contributions have been paid during the period of that service), take up temporary employment in a medical school or with the Medical Research Council can continue contributing to the N.H.S. superannuation scheme.

Contributions are based on the remuneration attaching to the new post and are deducted by the employing body, which pays the employer's share.

To take advantage of these arrangements the officer must complete Form S.D. 65 (obtainable from the medical school) or S.D. 66 (obtainable from the Medical Research Council) and return it to the employing body within three months of taking up his new employment.

Further information may be obtained from the Superannuation Division of the Ministry of Health, Government Buildings, Honeypot Lane, Stanmore, Middlesex.

N.O.T.B. ASSOCIATION

The N.O.T.B. Association held its twentieth committee meeting on February 29, when reports from two sub-committees were considered and adopted.

"Non-tolerance"

The question of charges made to ophthalmic medical practitioners in non-tolerance cases was discussed, and two cases were mentioned where demands had been made for a refund of the fees concerned. The committee took the view that only in instances of gross professional negligence should the error be rectified at the practitioner's expense.

Special Medical Certificates

The committee noted some spread of demand from patients who, having been examined through the supplementary ophthalmic service, required a special certificate for their employers. The committee was strongly of the opinion that ophthalmic medical practitioners should decline to provide such certificates free of charge, as this was outside their terms of service.

Report on the Future Eye Services

The committee approved a confidential report on the future eye services for circulation to all members with the annual general meeting agenda.

The next meeting of the committee was arranged to take place before the annual general meeting, held on March 28.

Correction.—We regret that Professor R. G. D. Allen's initials were given incorrectly in our report of the adjudication in the *Supplement* of March 22 (p. 108).

Questions Answered

Dispensing During Confinements

Q.—As a dispensing doctor receiving 6s. 6d. per patient per annum for drugs, am I entitled to claim extra for drugs used on my patients during confinements when they have completed Form E.C.24 (application form for maternity medical services)?

A.—A practitioner may claim on the executive council for those expensive items which are included in the special list and/or the list maintained under the medical aid arrangements. Inexpensive drugs are borne by the doctor, for which he is paid by capitation fee. The supply of inexpensive dressings is still under discussion with the Ministry.

Allowable Expenses

Q.—What is the position for income-tax allowance of (1) B.M.A. subscription, (2) defence society subscription, (3) medical library subscription, (4) purchase of medical textbooks, (5) purchase of instruments, (6) telephone expenses in the case of (a) principal, (b) assistant in general practice?

A.—To the doctor assessed on Schedule D all the above are allowable, subject to the exception that to the extent to which they represent capital outlay they are not allowable. For instance, the expense of replacing worn-out or obsolete instruments and books is allowable, but not the expense of adding to the existing equipment or library.

For the doctor assessed on Schedule E the position here is different. The statutory rule requires allowable expenses to have been incurred wholly, exclusively, and necessarily in the performance of the duties of the office, etc., and the rule has been strictly construed in a number of High Court decisions. Broadly speaking, the expenses listed are not allowable unless the employing authority specifically requires the individual concerned to incur the expenses as a condition of his employment.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Hackney, Southwark, Stoke Newington.

Non-County Borough Councils.—Crewe.

Urban District Councils.—Droylsden, Houghton-le-Spring.

The National Insurance Advisory Committee has been asked to consider and report upon the preliminary draft of regulations which would amend the existing National Insurance (Determination of Claims and Questions) Regulations. The need for the regulations arises from the recent amendment to Overlapping Benefits Regulations. A person awarded an unemployability supplement to an allowance under the Pneumoconiosis and Byssinosis Benefit Act, and who is at the same time entitled to any National Insurance benefit, has his National Insurance benefit reduced by the amount of the supplement. The amending regulations would enable the local insurance officer, when an unemployability supplement is back-dated to cover a period for which a National Insurance benefit has already been paid, to require repayment of that benefit to the extent that benefit and supplement overlap. Power would also be given to recover the benefit from the arrears of the unemployability supplement. Copies of the preliminary draft of these regulations (the National Insurance (Determination of Claims and Questions) Amendment Regulations, 1952) can be purchased from H.M. Stationery Office (price 2d.) or any bookseller. The committee will consider written objections if sent before April 15, 1952, to the Secretary, National Insurance Advisory Committee, 30, Euston Square, London, N.W.1.

British Medical Association and Irish Medical Association

JOINT ANNUAL MEETING—DUBLIN, JULY 3-11, 1952

President-Elect: P. T. O'FARRELL, M.D., F.R.C.P.I., D.T.M., D.P.H., Dublin

PROVISIONAL PROGRAMME

The 120th Annual Meeting of the British Medical Association will be held in Dublin from Thursday, July 3, to Friday, July 11, 1952, as a joint meeting with the Irish Medical Association.

The first part of the Meeting—the Annual Representative Meeting—will be held in the Round Room, Mansion House, Dublin, starting at 10 a.m. on Thursday, July 3, and concluding on Monday, July 7.

The Overseas Luncheon and Representatives' and Ladies' Dinners will take place on Thursday, July 3; and there will be all-day excursions for Representatives and their Ladies on Sunday, July 6.

The adjourned Annual General Meeting and President's Address will take place at Trinity College on the evening of Monday, July 7, and will be followed by the President's Reception.

At an early stage of the second part of the Meeting—the Annual Meeting proper—there will be two Religious Services, Protestant and Catholic, held on Tuesday morning, July 8, preceding the opening Plenary Scientific Session, to be held in the Round Room, Mansion House.

The holding of three Plenary Scientific Sessions on the mornings of July 8, 9, and 10, in addition to the meetings of the Scientific Sections, is an innovation which it is hoped will prove of interest to the majority of members. These Plenary Sessions will be addressed by a number of experts and then opened for questions or general discussion. The subjects chosen are: "Death in Early Adult Life," "The Relief of Pain," and "Body Fluids and Water Balance."

In addition to the Plenary Sessions there will be 14 Scientific Sections, meeting in the afternoons of Wednesday and Thursday, July 9 and 10, and all day on Friday, July 11, at Trinity College, University College, Royal College of Physicians, and Royal College of Surgeons. These Sections will be:

Medicine	Two sessions	July 10 (p.m.) July 11 (a.m.)
Surgery	" "	July 9 (p.m.) July 11 (a.m.)*
Obstetrics and Gynaecology ..	" "	July 11 (a.m. and p.m.)
Anaesthetics ..	One session	July 9 (p.m.)
Cardiology .. .	" "	July 9 (p.m.)
Child Health ..	" "	July 10 (p.m.)
Ophthalmology ..	" "	July 11 (p.m.)
Orthopaedics ..	" "	July 10 (p.m.)
Oto-rhino-laryngo- logy	" "	July 9 (p.m.)
Pathology	" "	July 10 (p.m.)
Psychiatry .. .	" "	July 11 (a.m.)
Radiology	" "	July 11 (p.m.)
Social Medicine and Occupational Health	" "	July 11 (a.m.)
Tropical Medicine ..	" "	July 11 (p.m.)

*Amended time.

Individual programmes for these Sections will be published in a later issue of the *Journal*.

The Annual Dinner of the Association will be held on Thursday, July 10.

Among the many social functions to be arranged it is hoped to hold a State Reception on the evening of Wednesday, July 9; a Garden Party at Trinity College

on the afternoon of Thursday, July 10; and a dance at the Royal College of Surgeons in Ireland on Friday, July 11.

It is proposed to hold the Secretaries' Conference in Dublin on the afternoon of Tuesday, July 8, and the Overseas Conference on the afternoon of Wednesday, July 9.

The Reception Room for registration in University College, Earlsfort Terrace, will be opened on Monday, July 7, at 9 a.m. The Ladies' Club will be situated at Newman House, St. Stephen's Green, and will be open throughout the Meeting.

The Annual Exhibition of Surgical Appliances, Foods, Drugs, and Books will be housed in University College, Dublin. The official opening will take place on Monday, July 7, at 9 a.m., and the Exhibition will remain open on July 8, 9, 10, and 11, from 9 a.m. to 6 p.m.

It is hoped also to hold a small Scientific Exhibition in University College, Dublin (in place of the Pathological Museum).

ACCOMMODATION AND TRANSPORT

Dublin is a capital city of great charm and beauty which cannot fail to provide something of interest to every visitor. It is rich in history, architecture, variety of scenery, and variety of entertainment.

Hotel Accommodation

Hotel accommodation in Dublin is at present very limited owing to a strike of hotel employees affecting many of the larger hotels. The list given below consists of hotels unaffected by the strike at which accommodation was available at the time of going to press. Members still requiring accommodation are advised to apply *as soon as possible* direct to the hotel concerned, stating that they are attending the B.M.A. and I.M.A. Meeting. The Irish Tourist Association, of 14, Upper O'Connell Street, Dublin, is available for information and advice to any members who would like further particulars regarding accommodation.

There are a number of alternative routes open to members visiting Dublin, but traffic on *all* these routes during the summer months is very heavy. For the comfort and convenience of members, therefore, the Association has approached the transport companies with a view to securing reservations on trains and planes. These reservations can be made, however, only if the companies receive in good time an indication of the number of passengers likely to travel by the various routes.

The Shirley James' Travel Service, Ltd., of Tavistock House South, Tavistock Square, London, W.C.1. the official Travel Agency for B.M.A. House, has been asked to handle these travel inquiries, and members are invited to communicate with this Agency *as soon as possible*, stating the route selected, the proposed date of travel to and from Dublin, and the number of passengers. Briefly, the alternative direct routes open to visitors to Dublin are as follows:

Air

Birmingham-Dublin
Bristol-Dublin (restricted service)
Glasgow-Dublin
Liverpool-Dublin
London-Dublin
Manchester-Dublin

Rail and Sea

Holyhead-Dun Laoghaire (Kingstown)
Liverpool-Dublin
Glasgow-Dublin (restricted service)

SCIENTIFIC EXHIBITION

A Scientific Exhibition will be staged in the Convocation Hall of University College, Dublin, from July 8 to 11 in connexion with the Joint Annual Meeting of the British Medical Association and Irish Medical Association.

Applications for space at the Exhibition, which must be accompanied by brief details of the proposed exhibit, should be received *not later than March 31* and should be addressed to the Organizing Committee, Scientific Exhibition, Irish Medical Association, 10, Fitzwilliam Place, Dublin.

Each stand will be 10 ft. wide and 6 ft. deep and the walls will be 8 ft. high. The front will be open, and a shelf 2 ft. 6 in. above the floor and 1 ft. wide will extend all round the three walls. Chairs will be provided if required. Fluorescent lamps will be fitted to the walls but can be omitted if exhibitors require indirect lighting for show-cases, transparencies, etc. The current is A.C. 200-240 volts.

The exhibitor will be expected to pay the cost of the preparation, transportation, and installation of his exhibit, but no other expense will fall on him unless he requires alterations to the booth or special construction. Although it is hoped that the latter may not be required, any special demands will be dealt with sympathetically so far as possible. The cost of such alterations will be borne by the exhibitor.

No motion pictures will be shown in the booths, but separate arrangements will be made for these elsewhere. Exhibitors are expected to provide their own transparency cases for slides of x-ray films. There is ample free storage space for packing-cases.

Exhibits should be shown in the name of an individual person (or persons), who must be a member attending the Annual Meeting. The name of the hospital or institution at which he works may appear as part of the address.

The booths will be ready for the installation of exhibits on *Sunday, July 6*. Installation should be completed by *6 p.m. on Monday, July 7*.

GENERAL INFORMATION

Passports or travel permits are necessary when visiting Ireland, but no ration cards are required. There is no Customs restriction upon taking in reasonable personal effects.

Visitors may hire motor-cars in Dublin, thus avoiding the expense and trouble attached to taking cars over. The cost of hire is approximately £12 12s. a week for self-driven cars, and chauffeur-driven cars may be hired for about 1s. 3d. a mile. Those wishing to take over their own cars are advised to get in touch with the A.A. or R.A.C. as early as possible, as facilities are restricted.

SECOND LIST OF HOTEL ACCOMMODATION

TIME-TABLE OF MEETING

Thursday, July 3

- 9.00 a.m.—A.R.M. Inquiry Office opens at Mansion House, Dawson Street.
 9.30 a.m.—Ladies' Club opens at Newman House, St. Stephen's Green, for registration of Ladies and for tours.
 10.00 a.m.—Annual Representative Meeting opens at Mansion House, Dawson Street.
 11.00 a.m.—Welcome by Lord Mayor of Dublin to A.R.M.
 1.00 p.m.—Overseas Luncheon, Royal Hibernian Hotel, Dawson Street.
 2.30 p.m.—Excursions for Ladies.
 7.30 p.m.—Dinner for Representatives at Gresham Hotel, O'Connell Street.
 7.30 p.m.—Dinner or Fork Supper for Representatives' Ladies. The dinners will be followed by a Reception and Dance at Gresham Hotel.

Friday, July 4

- 9.00 a.m.—A.R.M. Inquiry Office open, Mansion House.
 9.30 a.m.—Ladies' Club open, Newman House.
 9.30 a.m.—A.R.M., Mansion House.
 2.30 p.m.—Excursions for Ladies.
 7.30 p.m.—Abbey Theatre or evening excursions.
 7.30 p.m.—Edinburgh Graduates' Dinner, Gresham Hotel.

Saturday, July 5

- 9.00 a.m.—Council Meeting, Council Chamber, Royal College of Physicians.
 9.00 a.m.—A.R.M. Inquiry Office open, Mansion House.

- 9.30 a.m.—Ladies' Club open, Newman House.
10.00 a.m.—A.R.M., Mansion House.
2.30 p.m.—Excursions for Ladies.
7.30 p.m.—Glasgow Graduates' Dinner, Royal Hibernian Hotel.
7.30 p.m.—Welsh Dinner, Metropole Restaurant.
7.30 p.m.—Abbey Theatre or evening excursions.

Sunday, July 6

- a.m.—Long excursions by coach.
p.m.—Short excursions by coach.

Monday, July 7

- 9.00 a.m.—A.R.M. Inquiry Office open; Mansion House
9.00 a.m.—Opening of Exhibition by President-Elect, University College, Earlsfort Terrace.
9.00 a.m.—Reception Room opens at University College, Earlsfort Terrace, for registration.
9.30 a.m.—A.R.M., Mansion House.
10.00 a.m.—Annual Meeting, Irish Medical Association, Physics Theatre, University College, Dublin.
12.30 p.m. (or as soon thereafter as the business of the A.R.M. is concluded).—Annual General Meeting, Mansion House.
Council Meeting (at conclusion of A.R.M.). Royal College of Physicians.
8.30 p.m.—Adjourned Annual General Meeting and President's Address, Trinity College.
9.30 p.m.—President's Reception, Trinity College.

Tuesday, July 8

- 9.00 a.m.—Roman Catholic Service, Pro-Cathedral.
9.00 a.m.—Reception Room and Exhibition open, University College.
9.30 a.m.—Protestant Service, Christ Church Cathedral.
9.30 a.m.—Ladies' Club open, Newman House.
10.45 a.m.—Scientific Plenary Session, Mansion House.
2.30 p.m.—Secretaries' Conference, Royal College of Physicians.
7.30 p.m.—Secretaries' Dinner, Shelbourne Hotel.

Wednesday, July 9

- 8.30 a.m.—Annual Medical Missionary Breakfast, Royal Hibernian Hotel.
9.00 a.m.—Reception Room and Exhibition open, University College.
9.30 a.m.—Ladies' Club open, Newman House.
10.00 a.m.—Scientific Plenary Session, Mansion House.
10.00 a.m.—Notts Ladies' Challenge Cup Golf Competition.
10.00 a.m.—Leinster and Childe Cup Golf Competition.
10.00 a.m.—Excursion and tours.
12 noon.—Visit to St. James's Gate Brewery.
2.30 p.m.—Overseas Conference, Royal College of Surgeons.
2.30 p.m.—Scientific Sections, University College, Trinity College, and Royal College of Surgeons.
2.30 p.m.—Short tours.
5.00 p.m.—Overseas Cocktail Party, Royal College of Surgeons.
9.00 p.m.—State Reception.

Thursday, July 10

- 9.00 a.m.—Reception Room and Exhibition open, University College.
9.30 a.m.—Ladies' Club open, Newman House.
10.00 a.m.—Scientific Plenary Session, Mansion House.
10.00 a.m.—Treasurer's Cup Golf Competition.
10.00 a.m.—Excursions and tours.
12 noon.—Visit to St. James's Gate Brewery.
2.30 p.m.—Short tours.
2.30 p.m.—Scientific Sections, University College, Trinity College, and Royal College of Surgeons.
4.00 p.m.—Garden Party at Trinity College.
7.30 p.m.—Annual Dinner.

Friday, July 11

- 9.00 a.m.—Reception Room and Exhibition open, University College.
9.30 a.m.—Ladies' Club open.
10.00 a.m.—Scientific Sections, University College, Trinity College, and Royal College of Surgeons.
10.00 a.m.—Excursions and tours.
2.30 p.m.—Scientific Sections, University College, Trinity College, Royal College of Physicians, and Royal College of Surgeons.
9.30 p.m.—Dance in aid of R.M.B.F. Society of Ireland at Royal College of Surgeons in Ireland.

Correspondence

Dispensing Fees

SIR,—I was astonished to read (*Supplement*, March 1. p. 76) that there are 4,000 dispensing doctors in the N.H.S. If this is so, their interests are singularly badly served and it is high time that they made themselves heard.

Those who dispense under the capitation-fee system seem still to be greatly in the majority, yet there can be surely no doubt that the fee of 6s. 6d. is hopelessly inadequate and that it forces dispensing to be done on the cheap or at a loss. When it is realized that the average cost per patient per year for drugs and appliances is about 17s., and allowing for expensive drugs and appliances, the inadequacy is better understood.

We are advised by the B.M.A. to change over to the tariff system if we find the other unsatisfactory. There is, however, a grave defect in this. The price paid for prescriptions is calculated on the wholesale cost, to which an addition of 25% is added. Now the wholesale, or chemist's, price is 33½% below the retail, while the discount allowed to doctors is only 10%.

An example will show how this works to the disadvantage of doctors:

	s.	d.
Retail price of 12 capsules of chloramphenicol ..	36	0
Price to doctors	32	9
Price to chemists	24	0
Payment to doctors on prescription (24s. + 25% + dispensing fee of 9d. + container fee 1½d.) ..	30	10
Loss to doctor	2	0

The wholesalers claim that chemists have to carry large stocks and that this is the reason for the greater discount. Yet the Ministry bases the cost on the wholesale price as in the example above. In this case the fault lies with the wholesalers, whose association will not allow the same discount to dispensing doctors as they do to chemists. It is a matter that calls for immediate rectification.

I maintain that dispensing is an arduous and exacting addition to the work of a doctor and as such should carry an appropriate financial reward. I understand that a committee is considering these matters. Results are long overdue.—I am, etc.,

Rolvenden, Kent.

B. W. WYLLIE.

Unestablished Doctors

SIR,—The profession is now fully aware that the problems of the unestablished practitioner have greatly increased since the introduction of the N.H.S. The B.M.A. has consistently refused to support any betterment of the conditions of assistants or to help the small-list doctor; it has never brought forward nor supported any plan to encourage practitioners with large lists to take partners.

This negative policy led to the formation of the Unestablished Practitioners Group just over a year ago. As yet the B.M.A. has refused to recognize this group and claims to represent "adequately" the unestablished practitioner. The correspondence columns of the medical journals and the fact that this group already represents nearly 500 doctors invalidate this claim.

Until the problems involved are recognized by the B.M.A. and plans put forward for their alleviation, the Unestablished Practitioners Group will strive to implement its policy, in brief:

(1) To press for alterations in the N.H.S., in particular in the method of remuneration for general practitioners, designed to increase the number of established principals, primarily by encouraging partnership rather than assistantship, and also by helping the *bona fide* squatter.

(2) To render unprofitable the commercialized permanent assistantship system, by not allowing a principal who employs an

assistant any increase above the agreed maximum list permitted to an unassisted practitioner.

(3) To press for removal of restrictions on change of doctor.

(4) To modify the "trainee general practitioner" scheme so that the trainee would be employed not by the principal but by the executive council, who would pay the trainee's salary, be responsible for his conditions of work, and arbitrate in any dispute.

The terms of reference of the Working Party set up by the Ministry are "to secure a more equitable distribution of the central pool, to discourage unduly large lists. . . ." These are the very matters which affect the unestablished doctor most. But there is not one assistant or unestablished practitioner on this Working Party. One is justified in asking whether this is because the B.M.A. "adequately represents" the unestablished practitioner or whether it has merely forgotten this growing minority *which is already on a full-time salaried service imposed by the profession itself*. It should be remembered that the existence of a large number of unestablished practitioners is a threat to the prestige of the profession as a whole.

The unestablished practitioners have a just case and will succeed if they act through their own organization—the U.P.G. We therefore ask all doctors seeking entry into general practice, all assistants and small-list practitioners who have not already joined, to apply for membership of this group.—I am, etc.,

L. RUSSELL,

Chairman, Unestablished Practitioners Group.

* The Secretary of the Association writes: The General Medical Services Committee last year set up an Assistants and Young Practitioners Subcommittee to represent the interests of assistants and of young doctors wishing to enter general practice or not yet established in it. This subcommittee is representative in that elections have been held throughout the country and every assistant and unestablished practitioner has had an opportunity of recording his vote and electing a representative to serve on the subcommittee. In this way ten members have been elected by doctors whose interests the subcommittee serves. In addition, six members are appointed from the G.M.S. Committee. It has two representatives on the G.M.S. Committee. The B.M.A. has not "refused to recognize" the Unestablished Practitioners Group, as Dr. Russell asserts. The question of recognition has not arisen, but the B.M.A. subcommittee has been distinguished from Dr. Russell's organization in these columns. Although it is true that the Working Party does not include an assistant or unestablished practitioner, the views of the subcommittee have been ascertained and will continue to be sought as and when necessary.

Contracting Out of N.H.S.

SIR,—Dr. M. Solomon suggests (*Supplement*, March 15, p. 103) that a scheme for contracting out of the N.H.S. is impossible. Not only is it perfectly possible, but such a scheme is already under discussion by the Amending Acts Committee.

All that would be necessary would be good will on the part of the Government and help from the big insurance companies. An annual credit from the Treasury of a sum based on the cost per head of population to the country of the N.H.S. (say £10 gross) would be paid to the patient who contracted out. This credit would only be used to obtain insurance cover against all sickness and accident risks, and the patient would be required to produce evidence that it had been so used.

It would be desirable to indicate the 10d. per week taken from the N.I. contribution as a subvention to the N.H.S. funds, and this could be done by having two stamps instead of one. There has been "misunderstanding" about the purpose of the N.I. contribution from the very beginning of the N.H.S.—a "misunderstanding" which, as Dr. H. W. Forshaw so pertinently put it (*Supplement*, March 15, p. 105):

was probably "deliberately fostered by the Government then in power for very obvious reasons."

I doubt if Dr. I. E. D. McClean (*Supplement*, February 9, p. 55) intended, when he proposed that the right of patients to contract out of the Service (as in N.H.I. days) be restored, to suggest that the contractor should cease to pay N.I. contributions, though I can think of no valid reason why he should not do so if he were willing to forgo the various cash benefits. And, in passing, let it be remembered that all "self-employed persons," though they pay N.I. contributions, are entitled neither to unemployment nor to industrial injury benefits, and I dare say quite a number of them would be willing to eschew the benefits to which they are entitled, if they were allowed to drop the payment of their weekly 6s. 6d.

Dr. Solomon's last sentence is a more or less skilful attempt to cloud the issue. Certainly patients are *allowed* to seek their medical attention on a private basis, but this is not at all contracting out, for they still have to pay in taxation just as much as they would were they making every possible use of the N.H.S., and though still paying their whack they are discriminated against by being debarred from getting drugs and appliances on a Form E.C.10. I don't imagine that Dr. Solomon would seriously contend that this constitutes the right to contract out if he thinks things over.—I am, etc.,

Wolverhampton.

VICTOR RUSSELL.

Notes for Employers

SIR,—It would seem that our representatives in their meeting with the British Employers Federation, as reported in the *Supplement* of March 15 (p. 98), have let us down again. The employers complain that their welfare departments could not possibly investigate the very large number of absentees. We are therefore happily committed to doing their work.

I believe that, if this one item of service were jettisoned, general practice could play its full part in the N.H.S. and considerably relieve the out-patient departments of the hospitals. During the power cuts of a year or so ago our surgeries were almost empty. It was evident that it was not treatment that was required but notes. The medicine which is almost inevitably supplied with the note must be quite unnecessary.

If our policing of industry produced an accurate assessment of each individual, it might be worth this employment of a large part of a G.P.'s time. But with 50 patients waiting, any one of whom may be germinating a serious illness which it is our duty to diagnose early, how is it possible in trivial illness to decide scientifically if a man should work? With the greatest care one cannot exclude the chance of serious symptoms developing in the course of the next few hours, and I defy anybody to be certain of not being taken in by an intelligent man who sets himself out to deceive.

In fact, we deceive ourselves and the community and do no service to industry by pretending that the notes we issue in good faith, and with considerable trouble, in minor illness represent anything but the opinion and desire of the absentee.—I am, etc.,

Shirley, near Birmingham.

W. BRIAN GOUGH.

Doctors' Houses at Birmingham

SIR,—With reference to the letters from the Birmingham Executive Council and Dr. E. K. Morris' (*Supplement*, March 8, pp. 91 and 92) in reply to mine (*Supplement*, February 9, p. 55), would you allow me to make the following observations:

(1) I have the greatest regard for the clerk of the council and his staff. My criticism was only against the policies of the council.

(2) There is definite divergence of views between myself and the council about my appeal to the Minister, closure of my branch surgery, and my alleged acceptance of proposed rent without

comment. I stand by my original statement and am willing to substantiate it at an independent inquiry.

(3) I wished to build the house with my own money. I am still willing to buy the house from the Corporation. Why should a doctor be refused permission to build his house, if he has no worry about "initial heavy capital outlay"? In my opinion a doctor can render medical service as efficiently from his own house as from a rented one.

(4) The local medical committee, to my knowledge, has never approved the £300 rent. Most members of the committee feel that this rent is excessive and should be reduced and also that doctors with their own capital should be allowed to build their own houses.

(5) Dr. E. K. Morris quotes regulations, but forgets that I never asked the council to provide accommodation, nor did I apply for a Corporation house. He defends the rent by saying that a doctor's house and surgery are regarded as business premises. In Birmingham doctor's premises have always been rated as residential premises. His comparison with the shops next door does not reveal the fact that a shopkeeper pays only £180 rent for his shop and two-storeyed residential accommodation as against £300 for the doctor's house. As for the premium, a shopkeeper creates goodwill out of nothing and can sell it for a tidy figure. Has Dr. Morris forgotten that nowadays a doctor has no goodwill to sell?

Coming from the personal to the general aspect of the problem, I hope this correspondence will result in joint consultations between the executive council, the local medical committee, and the local authority, so that houses could be made available to unestablished doctors with speed and for reasonable rent.—I am, etc.,

Birmingham

D. R. PREM.

Registrar Appointments

SIR,—I should like to support Professor Charles Wells (*Supplement*, March 15, p. 102) in his suggestion that we do need in hospital a junior grade of consultant. The present tendency to get patients up much earlier after operation, and the remarkable reduction in complications brought about by antibiotics, have led, at any rate in urology, to a very much increased turnover of beds; operating sessions tend to become positive marathons.

I think there would be a place as third and junior member of a firm for a man who had secured a permanent place as a consultant in the National Health Service, but who was whole-time, and so acting in the true sense as an assistant to the senior member of the firm.—I am, etc.,

Birmingham.

HUGH DONOVAN.

Branch and Division Meetings to be Held

ALDERSHOT AND BASINGSTOKE DIVISION.—At Rotherwick Village Hall, Wednesday, April 2, 9 p.m., annual general meeting.
COVENTRY DIVISION.—At Pilot Hotel, Burnaby Road, Coventry, Tuesday, April 1, 7.30 for 8 p.m., supper meeting. Dr. Alistair French: "Legal and Ethical Aspects of Medical Practice." Questions and discussion are invited.

DEWSBURY DIVISION.—At Dewsbury General Infirmary, Friday, April 4, 8.30 p.m., address by Dr. Donald Teare: "Murder." To be illustrated with lantern slides. All medical practitioners in area of Division are invited.

HAMPSTEAD DIVISION.—At New End Hospital, Heath Street, London, N.W., Wednesday, April 2, 8.30 p.m., talk by Dr. Keith Simpson: "What to do with a Dead Body." Illustrated by lantern slides. All medical practitioners in the area of the Division are invited.

LEWISHAM DIVISION.—At Lewisham Hospital, 390, High Street, Lewisham, S.E., Friday, April 4, 8.30 p.m., meeting.

MID-ESSEX DIVISION.—At Mid-Essex Technical College, Market Road, Chelmsford, Sunday, April 6, 10 a.m., clinical meeting. Films, talks, and discussions.

NORTH MIDDLESEX DIVISION.—At North Middlesex Hospital, Silver Street, Edmonton, N., Tuesday, April 1, 8.45 p.m., annual general meeting.

NUNEATON AND TAMWORTH DIVISION.—At Red Lion Hotel, Atherstone, Tuesday, April 1, 8 p.m., supper; 8.45 p.m., address by Mr. T. Sergeant: "The Use and Abuse of Physiotherapy."

REIGATE DIVISION.—At Redhill County Hospital, Tuesday, April 1, 8.30 p.m., Dr. Donald Teare: "Homicide."

SCUNTHORPE DIVISION.—At War Memorial Hospital, Scunthorpe, Thursday, April 3, 8.30 p.m., lecture by Dr. W. N. Pickles: "Epidemiology in Country Practice."

SWINDON DIVISION.—At Goddard Arms Hotel, Swindon, Tuesday, April 1, 7.45 for 8.15 p.m., B.M.A. Dinner. Dr. S. J. Hadfield (Assistant Secretary, B.M.A.): "General Practice and Recent Medical Events."

Meetings of Branches and Divisions

SOUTHAMPTON DIVISION

A successful meeting was held on January 16, when the chairman, Dr. J. R. Kingdon, presented Mr. R. W. Knowlton with a bookcase as a memento of fifteen years as secretary of the Division.

Dr. W. S. C. Copeman delivered an address entitled "Cortisone, A.C.T.H., and the Rheumatic Diseases." After outlining the history of the discovery and use of A.C.T.H. and cortisone in the treatment of rheumatoid arthritis, he pointed out that the principle of their action was replacement in the case of cortisone and stimulation of production by suprarenals in the case of A.C.T.H. Discussing treatment, he stressed the importance of finding the minimal dose necessary for the patient, with occasional boosting on the appearance of any remission. The reduction in the dosage of cortisone should take place very slowly. Dr. Copeman discussed certain reactions that might occur, and pointed out that use of these hormones was still experimental. The cost of treatment was still very high, and he could not see that there would be much reduction in expense in the future. As regards the value of the hormones in general practice, he considered that cortisone would be of definite advantage over A.C.T.H., which required four-hourly injections.

After the address a short film was shown illustrating cases which had benefited from the therapy. This was followed by an interesting discussion in which the most important point emphasized was that all methods of treatment, including gold, used before the discovery of the action of these hormones should still be employed.

The chairman thanked Dr. Copeman for his interesting and valuable address.

PRESTON DIVISION

The annual B.M.A. Lecture was delivered by Sir Daniel Davies, Physician to King George VI, at Preston Royal Infirmary to a large and attentive audience on March 11. The title of the address was "The Changing Scene in Medicine." Sir Daniel dealt with the changes in medical diagnosis and treatment in the last twenty-five years or so, with particular emphasis on the advances in therapeutics. The introduction of insulin, liver therapy, the vitamins, the sulphonamides, penicillin, streptomycin, "aureomycin," cortisone, and A.C.T.H. had produced results undreamt of thirty years ago. In preventive medicine immunization had reduced to a small fraction the incidence of diphtheria and had almost abolished its mortality.

Not only had medicine changed but so also had disease incidence, and the greatly increased expectation of life in itself provided new problems. Not only had life itself been prolonged but the potential working life had also been extended, so that at 70 years of age a man faced life much as a man of 50 might have done a few decades ago. There were still many as yet unsolved problems to challenge the next generation of medical men.

In his address Sir Daniel was never at a loss for the apt quotation to illustrate a particular point. A vote of thanks to the lecturer was proposed by Mr. Ian Orr and seconded by Dr. D. J. Davies.

Corfe Castle, Dorset. One of the most interesting and impressive ruins in Southern England. Built by King John, and one of the last strongholds to fall during the Civil War, 1642-48.

Antacid and Adsorbent

The particular value of MAGSORBENT in chronic hyperchlorhydric disorders depends upon the moderation of its rate of interaction with acids. The time required for complete interaction approximates to the normal emptying time of the stomach. It can, therefore, be taken in generous excess of the amount required to combine with the acid present in the stomach at any particular moment, without risk of overneutralisation.

Formula: Magnesium Trisilicate 100%

Samples of MAGSORBENT Powder and Tablets,
also literature, are available on request

Support without Constriction . . .

LINIA BELT

designed under medical supervision to correct

FAULTY POSTURE and ENTEROPTOSIS.

Invaluable, too, for POST-OPERATION WEAR.

Arrow No. 1. Shows how the Linia Belt acts on parts that are usually protuberant, in harmony with the over-all pressure.

Arrow No. 2. Shows how the Linia Belt lifts and holds in place the lower abdominal parts that have sagged and dilated.

Arrow No. 3. Shows uplifting support on the groin, a protection against rupture and strain.

It avoids the danger of exercising direct restricting pressure on the abdomen. Besides affording support and restoring displaced organs to their correct position, the Linia Belt exerts a gentle massaging action, at the same time bracing the muscles. It is invaluable too, for post-operation wear, and to prevent strain when older men, unused to violent physical effort, take exercise.

She needn't miss a nursing...

for the prevention
and treatment of
cracked nipples

Masse's

contains
9-amino acridine 0.0695%
and allantoin 2%
in a cream base.
Supplied in
1 oz. tubes

Masse's NIPPLE CREAM...

- used after each nursing — helps prevent tender nipples, fissures, abrasions and mastitis. It hastens healing of cracked nipples and reduces the probability of breast infection.
- used during the last trimester of pregnancy — keeps the nipples pliable and resilient, and is useful in massaging out flat or inverted nipples.
- easily applied by the mother — is readily absorbed and non-toxic; does not interfere with nursing.

It adds up to perfection in the making of syringes

Every 'Plim' hypodermic syringe is an individual production, made by highly skilled craftsmen. That is the only way to ensure true accuracy, perfect functioning and consistently good service.

But there is something more to the 'Plim' syringe than just good craftsmanship—the *special design* which provides additional advantages to the user.

Consider these features:

No solder or cement is used in the process of manufacture; sterilization can be done up to 200° C.

The protective metal casing reduces risk of damage to a minimum.

Glass barrels are available from stock, but users may order a spare barrel for instant replacement.

Every part of the syringe is precision made and interchangeable.

ROBINSON'S

Robsoup

THE NEW WEANING FOOD
FOR BABIES

ROBSOUP is a concentrated bone and vegetable soup, ready cooked in powder form. The food constituents are different from and complementary to those of milk mixtures and cereals.

Robsoup mixes instantly with water at all temperatures to any consistency from a thin broth, suitable for adding to the baby's bottle, to a thick soup which may be fed from cup and spoon.

Robsoup is simple to use and economical—a 1/6d. tin gives ten helpings for a baby of five months. There is no waste with Robsoup. Only the amount required for the next meal is mixed at any one time. Being a dry powder, what is left in the tin will not go bad.

Therefore, provided the water used for mixing has been boiled and the cup and spoon are clean, Robsoup is safe from the danger of food infection and will not occasion gastro-enteritis.

Robsoup is made by a new process from peas, potatoes, carrots, yeast extract, cabbage, gelatin, edible bone phosphate, salt and onion. It is rich in iron (12 mg. per 100 gms.), calcium (400 mg. per 100 gms.) and vegetable protein (15.5%). Robsoup may therefore be given either as the first addition to milk or as the next step in weaning after the introduction of a cereal. Extensive tests have shown that babies thrive on Robsoup and like its flavour.

Write for free trial tin and descriptive leaflet to Dept. MH36:—

KEEN ROBINSON & CO. LTD.
CARROW WORKS NORWICH

APPOINTMENTS

Applicants should state name, address, age, nationality, qualifications, and enclose 3 copies (unless otherwise specified) of recent testimonials with short statement of experience and appointments held.

Applications should be sent at once if no closing date is given.

Canvassing in any form will disqualify.

**SERVICE MEMBERS may have difficulty in supplying recent testimonials, but this should not deter them from applying.*

Deferment of call-up for "R" practitioners (i.e., practitioners liable for call-up under the National Service Acts) is granted at the discretion of the Central Medical War Committee and (in Scotland) the Scottish Central Medical War Committee. The Committees normally allow an "R" practitioner to hold a First House Officer post (N.H.S. salary £350 per annum) provided that he obtains it without delay. Under present arrangements the Committees also normally allow an "R" practitioner to hold a Second House Officer post (£400) and a Senior House Officer post (£670), provided in each case that the higher appointment is secured before the termination of the practitioner's current appointment.

"R" practitioners may not accept Third House Officer posts (£450 per annum) unless they have obtained the special permission of the C.M.W.C. or (in Scotland) the Scottish C.M.W.C.

SALARY SCALES OF JUNIOR GRADES OF HOSPITAL MEDICAL STAFF

Registrar Grades, Whole-time

(a) **REGISTRAR**: Posts obtained normally not less than two years after registration as a medical or dental practitioner and held normally for two years: £775 per annum in the first year; £890 per annum in the second and any subsequent years.

(b) **SENIOR REGISTRAR**: Posts obtained normally not less than four years after registration as a medical or dental practitioner and held normally for three years: £1,000 per annum in the first year; £1,100 per annum in the second year; £1,200 per annum in the third year; £1,300 per annum in any subsequent years.

Other Grades, Whole-time

(a) **HOUSE OFFICER**: £350 per annum for the first post held, £400 per annum for the second post held; £450 per annum for the third and any subsequent post held; with, in each case, a deduction at the rate of £100 per annum in respect of board and lodging and other services provided. Each post shall be tenable for six months.

The Minister will be prepared to authorize, in exceptional circumstances, salaries up to £50 per annum higher than the standard rates specified above where a post cannot be filled otherwise.

(b) **SENIOR HOUSE OFFICER**: Posts obtained normally not less than one year (in Scotland, two years) after registration as a medical or dental practitioner and normally held for one year only: £670 per annum.

(c) **JUNIOR HOSPITAL MEDICAL OFFICER**: Officers who have held house appointments but who are not Registrars and who have less responsibility than other hospital officers of non-consultant status: £700 (for an officer appointed not less than two years after registration as a medical practitioner) by £50 to £1,000 per annum.

ALL NATIONAL HEALTH SERVICE HOSPITAL APPOINTMENTS ARE IN ACCORDANCE WITH THE TERMS AND CONDITIONS OF SERVICE OF HOSPITAL MEDICAL STAFF

Those intending to apply for resident appointments in the Registrar grades are recommended to make inquiries with regard to the deductions proposed for board and lodging at the time of submitting their applications, where this is not stated in the advertisement.

BLOOD TRANSFUSION**CARDIFF—WELSH REGIONAL HOSPITAL BOARD**

Applications are invited from registered medical practitioners for the appointment of

ASSISTANT MEDICAL OFFICER

(S.H.M.O. scale) at the Regional Blood Transfusion Service, Cardiff

Candidates should preferably have had previous experience in this branch. Twelve copies of application, stating date of birth, giving a summary of qualifications, experience, previous appointments (with dates) and publications, with names of three referees, should be addressed to the Senior Administrative Medical Officer, Welsh Regional Hospital Board, Cathays Park, Cardiff, within twenty-one days of appearance of this advertisement. (2143)

CARDIOLOGY**WIRRAL CALDY MANOR HOSPITAL, Caldy** (41 beds)

North Wirral Hospital Management Committee
Applications are invited from registered medical practitioners, male or female, for appointment of

RESIDENT HOUSE PHYSICIAN

for the above new hospital, which specializes in the treatment of heart cases. The appointment will become vacant on April 1, 1952, and will be tenable for six months. Salary in accordance with the approved scales, viz., first post held £350 per annum, second post held £400 per annum, and £450 per annum for the third and any subsequent post held. A deduction at the rate of £100 per annum will be made in respect of board, lodging, and other services provided. Applications, stating age, nationality, qualifications and details of experience, with names of three referees, should be sent immediately to the Secretary, North Wirral H.M.C., Leasowe Children's Hospital, Moreton, Wirral, Cheshire. (8832)

CHEST AND TUBERCULOSIS**LEEDS REGIONAL HOSPITAL BOARD**

Applications are invited for the appointment of a
CONSULTANT CHEST PHYSICIAN (Whole-time)
at the Bradford Chest Clinic. Applicants should possess high medical qualifications and extensive experience of pulmonary tuberculosis and other diseases of the chest. The successful applicant will be the senior member of a team consisting of two Assistant Chest Physicians of Senior Hospital Medical Officer status and a Registrar. There is close collaboration with the Thoracic Surgical Unit at the Bradford Royal Infirmary, and a new chest clinic is nearing completion in the grounds of St. Luke's Hospital, Bradford. The person appointed will be responsible for the administration of a Sub-Regional Tuberculosis Admission Bureau, serving the western half of the Region, and for the supervision of the Mass Radiography Unit based upon the Bradford Clinic. He will also be responsible to the Local Health Authority through the Medical Officer of Health for functions relating to the prevention, care and after-care of tuberculosis under Section 28 of the National Health Service Act. Applications, stating age, qualifications, and details of present and previous appointments (with dates), together with the names of three referees, should be forwarded to the Secretary, Park Parade, Harrogate, not later than April 12, 1952. (9990)

BRADFORD CHEST CLINIC

Leeds Regional Hospital Board
Applications are invited for the whole-time appointment of

ASSISTANT CHEST PHYSICIAN

(S.H.M.O. Scale)

The appointment offers considerable scope for experience in tuberculosis and diseases of the chest, and the person appointed will be under the direction of the Consultant Chest Physician for the area. The duties will include attendance at chest clinic sessions, general hospitals and sanatoria within the area and such domiciliary visits as may be necessary. They will also include preventive care and after-care work on behalf of the Local Health Authority, and the salary may be subject to adjustment in respect of this work. The possession of a higher qualification will be an advantage, and previous experience in the specialty is essential. Applications, stating age, qualifications and details of present and previous appointments (with dates), together with the names of three referees, should be forwarded to the Secretary, Park Parade, Harrogate, not later than April 26, 1952. (2081)

LEICESTER ISOLATION HOSPITAL AND CHEST UNIT, Groby Road, Leicester

Sheffield Regional Hospital Board
Applications are invited from registered medical practitioners for the whole-time post of

DEPUTY PHYSICIAN SUPERINTENDENT

There is a thoracic surgical centre at this hospital. Clinical duties will be mainly on the chest side. Candidates should have a good general medical experience and special experience in the treatment of chest diseases and tuberculosis. Salary scale £1,300 by £50 to £1,750 per annum. Application forms and further details may be obtained from the Senior Administrative Medical Officer, Sheffield Regional Hospital Board, Fulwood House, Old Fulwood Road, Sheffield, 10. Completed forms should be returned to the Secretary not later than April 19, 1952. (9781)

SOUTH-EAST METROPOLITAN REGIONAL HOSPITAL BOARD

Applications are invited for two appointments as
WHOLE-TIME REGISTRAR IN DISEASES OF THE CHEST

In the Lewisham Group of Hospitals, for duty in the first instance at Grove Park Tuberculosis Hospital

At Preston Hall Hospital, British Legion Village, Maidstone, Kent

Candidates must have good experience in general medicine and in the diagnosis and treatment of pulmonary tuberculosis in adults. The appointments will be in accordance with the terms and conditions of service of hospital medical and dental staff (England and Wales), and will be for one year in the first instance. Applications, giving particulars of age, qualifications, and experience, with relevant dates, together with the names and addresses of three referees, to be sent to the Secretary, Registrars Committee, South-East Metropolitan Regional Hospital Board, 11, Portland Place, W.1, not later than April 18, 1952. (2026)

CARDIFF, GLAN ELY HOSPITAL, Fairwater (236 beds) which deals with cases of respiratory and non-respiratory tuberculosis**Welsh Regional Hospital Board**

Wanted immediately a
LOCUM TENENS REGISTRAR IN DISEASES OF THE CHEST

The post is resident, will be for a period of six months, and the salary will be in accordance with the terms and conditions of service. Applications to be sent immediately, with the names of two referees, to the Senior Administrative Medical Officer, The Temple of Peace and Health, Cathays Park, Cardiff. (2283)

Chest and Tuberculosis—contd.**LEEDS REGIONAL HOSPITAL BOARD**

Applications are invited for the post of **REGISTRAR IN CHEST DISEASES**. The initial duties will be with the Mass Radiography Service in Hull, under the immediate supervision of the Senior Chest Physician in the area. Ample facilities will also be given for clinical work at the parent chest clinic, attendance at Sanatoria and General Hospitals, etc. After a satisfactory term in mass radiography, suitable candidates will be considered for a further period of training in selected regional sanatoria. This is essentially a trainee specialist post and only applicants possessing a first-rate clinical background in chest work will be considered. Applications, stating age, qualifications and details of present and previous appointments (with dates), together with the names of three referees, should be forwarded to the Secretary to the Joint Registrars Committee, Park Parade, Harrogate, not later than April 12, (2082)

WINDSOR CHEST CLINIC

North-West Metropolitan Regional Hospital Board
WHOLE-TIME REGISTRAR

Required for one year in first instance. Duties will include care of in-patients at Canadian Red Cross Memorial Hospital, Taplow, Bucks. Clinic may be visited by direct appointment. Application forms obtainable from, and returnable to, the Secretary, Windsor Group Hospital Management Committee, Kipling Memorial Building, Alma Road, Windsor, by April 7, 1952. (2083)

NORTH BERWICK, EAST LOTHIAN, EAST FORTUNE HOSPITAL (270 beds)

Applications are invited from registered medical practitioners for the resident whole-time post of **JUNIOR HOSPITAL MEDICAL OFFICER**. Salary £700 per annum by £50 to £1,000, less recognized charges for emoluments. Accommodation for married practitioner available. The hospital is modern, admitting all types of pulmonary and non-pulmonary tuberculosis, with thoracic, orthopaedic and genito-urinary surgery being done in the hospital. Duties may include both hospital and district work and an excellent opportunity is available for experience in all branches of tuberculosis work. Applications, stating age, qualifications and experience, with names of three referees, should be sent to the Secretary, East Lothian Hospitals Group Board of Management, 15, Court Street, Haddington, within fourteen days of appearance of this advertisement. (2128)

PAISLEY, INFECTIOUS DISEASES HOSPITAL

Thoracic Unit
Board of Management for Paisley and District Hospitals

Applications are invited from suitably qualified medical practitioners for the post of

JUNIOR HOSPITAL MEDICAL OFFICER for duty in the thoracic unit of the above hospital. Applicants should be at least two years qualified. Replies to be addressed to Group Medical Superintendent, Royal Alexandra Infirmary, Paisley, within two weeks of the date of this advert. (2222)

Applications are invited for the appointment of
Who's-time CONSULTANT PATHOLOGIST
for the Portsmouth and Isle of Wight Area Pathological Service

The successful candidate will be expected to be resident in the Isle of Wight and will be largely responsible for the co-ordination of clinical pathology for the island. Considerable experience in haematology and post mortem work is essential. The Consultant appointed will also be required to assist in the general running of the service in Portsmouth and to make regular visits to the Central Laboratory there. Applications (five copies), stating date of birth, qualifications, experience and present appointment, and giving the names and addresses of three referees, should be made by letter and sent to the Secretary (S.D.1), South-West Metropolitan Regional Hospital Board, 11a, Portland Place, London, W.1, to arrive not later than April 26, 1952. Applicants may visit the laboratories by local arrangement. (2103)

WELSH REGIONAL HOSPITAL BOARD

Applications are invited for the appointment of
CONSULTANT PATHOLOGIST

to serve the Cardiff Hospital Management Committee. He will be based at St. David's Hospital, Cardiff, but will be required to visit other hospitals in the district. Applicants should have had a sound experience in all branches of the specialty and preferably possess a higher qualification. Candidates are asked to state whether they wish to be considered for a whole-time or maximum part time appointment. Twelve copies of application, stating date of birth, giving a summary of qualifications, experience, previous appointments (with dates), and publications with names of three referees, should be addressed to the Senior Administrative Medical Officer, Welsh Regional Hospital Board, Cathays Park, Cardiff, within twenty-one days of appearance of this advertisement. (2326)

ASHFORD HOSPITAL, Ashford, Middlesex
North-West Metropolitan Regional Hospital Board

WHOLE-TIME ASSISTANT PATHOLOGIST
Required, with special experience in morbid anatomy and histology. Salary scale £1,300 to £1,750. Applications, giving date of birth and three referees, to Secretary, North-West Metropolitan Regional Hospital Board, 11a, Portland Place, W.1, by May 3, 1952. Hospital may be visited by direct appointment. (2234)

BLACKPOOL, VICTORIA HOSPITAL
Manchester Regional Hospital Board

Applications are invited for the whole-time, non-resident post of

ASSISTANT PATHOLOGIST
to the Group Laboratory. Experience of all branches of hospital pathology is desirable. The successful candidate will work under the general guidance of the Consultant Group Pathologist, and facilities for gaining general and special experience in different branches are available. Salary £1,300 by £50 to £1,750 per annum. Forms of application may be obtained from the Senior Administrative Medical Officer to the Board, at Cheetwood Road, Manchester, 8, and should be returned, with the names and addresses of three referees, to be received not later than April 14, 1952. (2264)

LEEDS REGIONAL HOSPITAL BOARD

Applications are invited from suitably qualified practitioners for whole-time, non-resident post of
ASSISTANT PATHOLOGIST (S.H.M.O. scale)
for duties in the Scarborough, Bridlington, Malton, and Whitby group of hospitals. Applicants should have had wide experience, and the possession of a higher qualification will be an advantage. The main hospital in the Group, the Scarborough General Hospital, houses a very active and well-equipped laboratory. The successful candidate will work under the general guidance of the Consultant in charge of the Department, and will be required to reside in Scarborough, or within such distance of that town as the Board may approve. Applications, stating age, qualifications, and details of present and previous appointments (with dates), together with the names of three referees, should be forwarded to the Secretary, Park Parade, Harrogate, not later than April 26, 1952. (2033)

DUNDEE, MARYFIELD HOSPITAL

Eastern Regional Hospital Board (Scotland)

Applications are invited for the post of

SENIOR REGISTRAR in Pathology

This is a teaching hospital of over 400 beds and provides a pathological service for general and special hospitals in Dundee and Angus. Applicants should have had training in all branches of pathology and should have special experience in morbid anatomy and histology. Salary and conditions of service in accordance with national agreement. Further particulars and forms of application from the Secretary to the Board, Braeknowe, 430, Blackness Road, Dundee, with whom applications must be lodged not later than April 5, 1952. (9891)

Applications are invited from registered medical practitioners for above appointments. Possession of D.P.H. desirable. Salary £850 by £50 to £1,150 per annum. Travelling and subsistence allowances where applicable. Posts superannuable and subject to medical examination. Application forms and further particulars obtainable from County Medical Officer of Health, East Cliff County Offices, Preston, to whom they must be returned not later than Saturday, April 12, 1952. (9485)

BANFF COUNTY COUNCIL

Applications are invited from registered medical practitioners for the post of

ASSISTANT MEDICAL OFFICER OF HEALTH**AND ASSISTANT SCHOOL MEDICAL OFFICER**

Preference will be given to candidates possessing the D.P.H. or D.C.H. The duties will consist of work mainly in connexion with the school medical and child welfare services, but will include such other public health work as the Medical Officer of Health may direct. Salary will be within the scale £850 per annum, rising by £50 per annum to a maximum of £1,150 per annum, the point of entry to be fixed in accordance with the candidate's experience and qualifications. A travelling allowance will be paid according to the County Council's scale, for the candidate's use of his own car. The appointment will be subject to the provisions of the Local Government Superannuation Act, 1937. Applications, stating age, qualifications and experience should be lodged with the subscriber, together with a copy of one recent testimonial, and the names of two persons to whom reference may be made, not later than seventeen days after the appearance of this advertisement.—R. J. Cumming, County Clerk, County Buildings, Banff. (2318)

BIRMINGHAM, CITY OF

Public Health Department

ADMINISTRATIVE MEDICAL OFFICER OF HEALTH FOR MENTAL HEALTH

Applications are invited from registered medical practitioners for the above whole-time appointment. Applicants should have had special experience in all branches of the mental health service and should hold the Diploma in Psychological Medicine. The successful candidate will be responsible to the Medical Officer of Health for the general administration and medical direction of all branches of the Council's mental health services and for the performance of such other duties in this connexion as may be required. Salary within the scale £1,600 by £50 to £1,850, according to experience. Motor car allowance payable. The candidate selected will be required to pass a medical examination, and to contribute to the Local Government Superannuation Act, 1937, and to the Birmingham Municipal Officers' Widows' and Orphans' Pensions Fund. The appointment is terminable at three months' notice. Canvassing disqualifies. Applications, with three recent testimonials, to be forwarded to the Medical Officer of Health, Public Health Department, Congreve St., Birmingham, 3, not later than April 19, 1952. (2319)

BOLTON, COUNTY BOROUGH OF

Two vacancies (one male and one female) exist for

ASSISTANT MEDICAL OFFICERS OF HEALTH**AND ASSISTANT SCHOOL MEDICAL OFFICERS****OF HEALTH**

and applications are invited from suitably qualified registered medical practitioners for such vacancies. The duties will be mainly in connexion with the maternity and child welfare service and the school health service, but the persons appointed will be expected to carry out such duties as may be allotted to them by the Medical Officer of Health. The possession of a D.P.H. or a D.C.H. is desirable but not essential. The salary will be on the appropriate step of the scale, £850 rising by annual increments of £50 to £1,150 per annum, according to experience and qualifications. The appointments will be subject to the provisions of the Local Government Superannuation Acts, and the successful candidates will be required to pass a medical examination. Appointments will be terminable by one month's notice on either side. There are no forms of application, but further particulars can be obtained from the Medical Officer of Health, Civic Centre, Bolton. Applications, giving full particulars of age, qualifications and experience, and the names and addresses of three referees, should be forwarded to the undersigned not later than April 16, 1952.—Philip S. Rennison, Town Clerk, Town Hall, Bolton. (9815)

District of Haltemprice (population 35,649) and
DIVISIONAL MEDICAL OFFICER for the
County Council within the same area**

The offices will be held as a joint full-time appointment. The total commencing salary will be £1,568 15s., rising to a maximum of £1,843 15s. The salary scale of the Medical Officer of Health will be £1,162 10s., rising by four annual increments of £37 10s. to £1,312 10s., and that of the Divisional Medical Officer £406 5s., rising by eight annual increments of £15 12s. 6d. to £531 5s. The officer will be required to provide a motor car for the purpose of his duties and will receive a travelling allowance appropriate to Class "B" of the scales adopted by the Medical Council for Public Health Medical Officers in England and Wales. Office accommodation and necessary clerical assistance will be provided. The appointment will be subject to the provisions of Section 110 of the Local Government Act, 1933, the Sanitary Officers' (Outside London) Regulations, 1935 and 1951, and the Local Government Superannuation Act, 1937. Applications must be made on forms to be obtained from the Clerk of the County Council, County Hall, Beverley, and must be forwarded, together with copies of not more than three recent testimonials, so as to reach the Clerk of the County Council not later than Thursday, April 10, 1952.—A. B. Glasspool, Clerk of the Urban District Council, T. Stephenson, Clerk of the County Council, County Hall, Beverley. (9861)

**SUNDERLAND, COUNTY BOROUGH OF
ASSISTANT MEDICAL OFFICER (Female)
for Maternity and Child Welfare**

Applications are invited from registered medical practitioners for the above-named post. Applicants should have had experience in antenatal work and in the medical care of children under five years of age. The salary will be £850 by £50 to £1,150 per annum (Medical Whitley Council scale). The appointment is subject to the provisions of the Local Government Superannuation Act, 1937, and the successful candidate will be required to pass a medical examination. Applications, stating age, qualifications, and full particulars of experience, accompanied by copies of three recent testimonials, should be sent to the undersigned not later than April 12, 1952.—G. S. McIntire, Town Clerk, Town Hall, Sunderland. (2254)

**WEST SUFFOLK COUNTY COUNCIL
COUNTY MEDICAL OFFICER OF HEALTH
AND SCHOOL MEDICAL OFFICER**

Applications are invited for the above whole-time appointment on a salary scale of £1,800 by £50 to £2,050 per annum, position on scale according to qualifications. Candidates must possess the qualifications prescribed in the Local Government Act, 1933, have wide knowledge and experience of duties of a Medical Officer of Health and possess sound administrative and organizing ability. Application forms and particulars of appointment obtainable from the undersigned, by whom applications should be received not later than April 19, 1952. Canvassing disqualifies.—L. G. H. Munsey, Clerk of the County Council, Shire Hall, Bury St. Edmunds. (2166)

INDUSTRIAL APPOINTMENTS

IMPERIAL CHEMICAL INDUSTRIES, LTD., Metals Division, require an Assistant Works Medical Officer, male, preferably under 30, in the Birmingham area. Commencing salary will be in the region of £1,000 to £1,200 per annum. Experience of industrial medicine desirable, but not essential. Applications should be sent to Staff Manager, Metals Division, Imperial Chemical Industries, Ltd., Kynoch Works, Witton, Birmingham, 6.

NATIONAL COAL BOARD—NORTH-WESTERN DIVISION.—Applications are invited for the post of Medical Officer to the No. 5 (North Wales) Area of the North Western Division. The work will include making underground visits to collieries. Candidates should have experience in the field of preventative and industrial medicine, a knowledge of the coalmining industry will be an advantage. Salary according to qualifications and experience, within the range of £1,250 to £1,900. Applications, giving age, education, qualifications, experience, present appointment and salary, together with the names of two referees, should be sent to the Divisional Establishment Officer, National Coal Board, North-Western Division, 40, Portland Street, Manchester, 1, by April 14, 1952. (2167)

PART-TIME MEDICAL OFFICER REQUIRED by Aircraft Factory near Southampton with well-established and well-equipped medical department. Duties to commence on May 1, 1952, following a short introduction by the present part-time medical officer who will be retiring. To attend for five morning sessions (Monday to Friday inclusive). Salary £700 per annum. Applications, stating age, qualifications and experience, should be sent to the Secretary, Folland Aircraft, Ltd., Hamble, Southampton.

GOVERNMENTAL**CIVILIAN SPECIALISTS FOR THE ARMY
OVERSEAS**

Immediate applications are invited for a limited number of appointments as

CIVILIAN SPECIALISTS IN SURGERY

for service with the R.A.M.C. overseas, in Hong Kong, Singapore, Malaya, Egypt, North, East, and West Africa, and garrisons in Europe. There are vacancies for men and women. Full particulars and application forms can be obtained from the Under-Secretary of State, The War Office (AMD.1), Lansdowne House, Berkeley Square, London, W.1 (telephone inquiries G.R.O.V.E.T.O.R. 8040 Ext. 548). Salary will be at the rate of £1,800 or £2,200 per annum. To qualify for the salary of £2,200 per annum an applicant must be experienced in the practice of his specialty, and must be a Fellow of one of the Royal Colleges of Surgeons. In addition, except in Germany and Austria, where different arrangements apply, a tax-free foreign service allowance will be paid to meet the extra cost of living at the duty station. Foreign-service allowance varies, according to the station at which employed and the status of the applicant, between £20 and £225 for single men and women and £90 and £390 for married men. An initial outfit allowance of up to £30 will also be paid, except for stations in Western Europe. Leave of 36 days a year may be granted subject to the exigencies of the service. Engagements will be for eighteen months, the whole of which time will be spent overseas. An extension of a further six months is possible. Superannuation payments under the National Health Service can be continued, if so desired, with the War Department paying employer's contributions. Pension rights under the National Health Service would thus be retained. Service with the War Department will also count for incremental purposes on re-employment under the National Health Service. Free accommodation, and, in some areas, free rations, will be provided for single individuals, but official accommodation will not be available for the families of married individuals. Rent of private family accommodation, and payment of passages for families, are the responsibility of the employee. (9630)

OVERSEAS**SOUTH AFRICA**

Important town. Medical Consultant practice for disposal. Receipts about £2,000 per annum. Details from Medical Practices Advisory Bureau, B.M.A., Tavistock Square, W.C.1.

AUCKLAND HOSPITAL BOARD, New Zealand
Applications are invited from medical practitioners eligible to qualify under the Hospital Employment Regulations, 1948, as a Junior Specialist for the position of

JUNIOR SURGICAL SPECIALIST
Green Lane Hospital

The appointment is a full-time one for a period of twelve months from date of commencing. If desired an extension of the term for a limited period would be considered by the Board. It is desirable that applicants be Fellows of a recognized College of Surgeons of the British Commonwealth. Salary scale, £N.Z.1,100 per annum, rising to £N.Z.1,400 by annual increments of £N.Z.50, plus £N.Z.160 general wage increase. The commencing salary will be according to qualifications and experience in the specialty. Living accommodation is not provided. Conditions of appointment and forms of application may be obtained from the office of the High Commissioner of New Zealand, 415, Strand, London, W.C.2, England. Applications close with the undersigned at the office of the Board, Kitchener Street, Auckland, New Zealand, at noon on Tuesday, April 29, 1952. —R. F. Galbraith, Secretary. (9816)

MCGILL UNIVERSITY, Montreal

A limited number of openings for training are available to British candidates in the Department of Psychiatry of McGill University, Montreal. Applicants must have graduated from an acceptable medical school and have had a general internship. The four-year course is designed primarily to prepare individuals to enter the fields of general hospital, community or university psychiatry, or to prepare them for research work in these fields. Credit may be allowed for previous training. Shorter periods of instruction may be arranged, as well as instruction in special fields. Those accepted for training are assigned to one of the seven university teaching areas in Montreal. These positions carry with them board and lodging and a small stipend. Applicants should write to the Chairman of the Department of Psychiatry, McGill University, Montreal, Canada. Interviews with a staff member will be arranged in London. The opening date for the new session is July 1, and applications are being currently considered. (2275)

HER MAJESTY'S COLONIAL SERVICE
Barbados**CHEMICAL PATHOLOGIST**

Required for the Bacteriological and Pathological Department of Barbados, to assist the Government Bacteriologist and Pathologist in clinical pathological and medico-legal work. Appointment will be on a permanent basis with pension (non-contributory) at the age of 55. Salary scale is from \$4,320 to \$4,800 (£900 to £1,000) per annum. (One Barbados Dollar equals 4s. 2d.) Pension is earned at the rate of 1/600th of the final pensionable emoluments for each completed month of service. Alternatively, employment is offered on agreement for three years with salary of \$4,800 to \$5,760 (£1,000 to £1,200) per annum, plus house allowance of £100 to £120 per annum. In addition a temporary cost-of-living allowance of \$156 (£32 10s.) per annum is payable to officers whether employed on permanent or contract terms. Free passages on appointment are provided for officer and family up to a total cost of £300. Leave passages are not provided. Income tax at local rates. Normal tour of service is two years. Climate is healthy for Europeans. Social and recreational amenities are good. Educational facilities are available. Candidates must possess medical qualifications registrable in the United Kingdom. They should also have a good knowledge of modern clinical pathology, especially of biochemistry as applied to clinical pathology. Application forms can be obtained from the Director of Recruitment (Colonial Service), Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1 (quoting reference No. 27106/48/52). (2333)

TOWNSVILLE GENERAL HOSPITAL
Applications are invited for the position of
PART-TIME PHYSICIAN

Appointee will be required to conduct four sessions of three hours each week, which includes one session during which the applicant is required to act as Supervising Officer of tuberculosis cases. Salary at the rate of £270 per annum per session of three hours. Private practice is allowed. Applications should be addressed to the Secretary, Townsville Hospitals Board, Townsville, North Queensland, Australia. Applicants should state age, whether married or single, and set out full details of qualifications and experience. The Board will not undertake to incur any expense in bringing any appointees to North Queensland, Australia. (9264)

HER MAJESTY'S COLONIAL SERVICE
Sierra Leone
PATHOLOGIST

Required for service in the Medical Department of Sierra Leone. Duties include clinical pathology, general pathology and medico-legal work. Appointment can be made on a permanent basis with pension (non-contributory) at the age of 45 to 55, or on short-term contract with gratuity on satisfactory completion of service. Candidates in the National Health Service may resign from their superannuation rights during their time in Sierra Leone (up to six years) and receive a resettlement grant of 20 per cent of the aggregate of their Colonial salary on leaving Sierra Leone at the end of their engagement. Salary scales, including expatriation pay, range from £890 to £1,600 per annum for pensionable employment, and from £1,030 to £1,720 per annum for contract appointment. A temporary (non-pensionable) allowance at the rate of 12½ per cent of basic salary (subject to a maximum of £125 per annum) is also payable. Starting salary is determined according to age, qualifications and experience. Pension is earned at the rate of 1/600th of the final pensionable emoluments for each completed month of service. The gratuity in respect of contract appointments is payable on termination at the rate of £50 per annum. Quarters are available at low rental but accommodation suitable for a family cannot be guaranteed. Free passages in both directions are provided for officer, wife and up to two children under the age of ten. Income tax at local rates. Tour of service is eighteen months. Local leave is permissible and generous home leave is granted after each tour. Candidates must possess medical qualifications registrable in the United Kingdom and have had postgraduate pathological experience. Application forms can be obtained from the Director of Recruitment (Colonial Service), Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1 (quoting reference No. 27215/317/52). (2335)

HER MAJESTY'S COLONIAL SERVICE
Gold Coast
RADIOLOGIST

Required in the Medical Department, Gold Coast. Duties are to take charge of an x-ray department, to carry out diagnosis and treatment, and to train junior staff as x-ray attendants. Appointments can be made on a permanent basis with pension (non-contributory) on retirement (the normal age of retirement is 50), or on short term contract with gratuity (reckoned at £37 10s. for each completed period of three months' service) on satisfactory completion of service. Candidates in the National Health Service may resign from their superannuation rights during their time in the Gold Coast (up to six years) and receive a resettlement grant of 20 per cent of the aggregate of their Gold Coast salary on leaving the Gold Coast at the end of their engagement. Salary scale for pensionable employment ranges from £1,060 to £1,600 per annum, and for short term contract from £1,200 to £1,750 per annum with gratuity or National Health Service resettlement grant. A temporary cost-of-living allowance at the rate of 15 per cent of basic salary is also payable to officers whether on permanent or contract terms. Quarters are provided at rental of £150 per annum. Free passages in both directions for officer and wife, and assisted passages for children. Income tax at local rates. Annual local leave is permissible and generous home leave is granted after each tour of eighteen months. Candidates must possess medical qualifications registrable in the United Kingdom and have obtained a Diploma in Medical Radiology and Electrolgy. Application forms can be obtained from the Director of Recruitment (Colonial Service), Sanctuary Buildings, Great Smith Street, London, S.W.1 (quoting reference No. 27215/352/52). (2334)

UNIVERSITY COLLEGE OF THE WEST INDIES

Applications are invited for the post of
LECTURER IN MEDICINE

The duties will include clinical work in the University College Hospital and instruction of students working for the medical degrees of the University of London. Salary scale is £800, rising by £50 per annum to £1,000. Point of entry in the scale according to qualifications and experience. Child allowance and temporary cost-of-living allowance is paid. Superannuation is under F.S.S.U. arrangements. Unfurnished accommodation is available at a rental of five per cent of basic salary. The successful applicant will be expected to take up the post during September 1952. Applications (twelve copies), giving full particulars of qualifications and the names of three referees, should be received before April 25, 1952, by the Secretary, Senate Committee on Higher Education in the Colonies University of London, Senate House, W.C.1, from whom further particulars may be obtained. (2337)

HER MAJESTY'S COLONIAL SERVICE, Trinidad
TWO RADIOLOGISTS

Required for service in the Health Department, Trinidad. Duties of each appointment are as follows: (a) To take administrative charge of and to work in the Radiological Section; to carry out radiological diagnosis and all forms of x-ray therapy; to act as Adviser to the Trinidad Government on matters relating to the organization of the radiological department, and the supply, standardizations and functioning of x-ray equipment; to organize the training and teaching of students in radiography and to perform such other specialized duties as may be required. (b) To act as deputy to the officer appointed under (a); to carry out radiological diagnosis, x-ray and other treatments and perform such other specialized duties as may be required. Appointments can be made on a permanent basis with pension (non-contributory) at the age of 55, or on short-term agreements. Candidates in the National Health Service may resign from the National Health Service but retain their superannuation rights during their time in Trinidad (up to six years) and receive resettlement grants of 20 per cent of the aggregate of their Trinidad salaries on leaving Trinidad at the end of their engagements. Salary for appointment (a) is \$6,480 (£1,350) per annum. Salary scale for appointment (b) ranges from \$5,760 to \$6,240 (£1,200 to £1,300) per annum. Pension is earned at the rate of 1/600th of the final pensionable emoluments for each completed month of service. Quarters are not provided. Free passages on first appointment are provided for officer and family, not exceeding five persons in all, and free passages on leave subject to a maximum of three adult fares. Income tax at local rates. Tour of service is three years. Local leave is permissible and generous home leave is granted after each tour. Education facilities are available. Candidates must possess medical qualifications registrable in the United Kingdom and a D.M.R.E., or equivalent recognized qualification, and should have had suitable experience in a recognized hospital in radio-diagnosis and radiotherapy. Application forms can be obtained from the Director of Recruitment (Colonial Service), Sanctuary Buildings, Great Smith Street, London, S.W.1 (quoting reference No. 27215/330/52). (2336)

HER MAJESTY'S COLONIAL SERVICE
Hong Kong

A Medical Officer with nutrition experience is required for duty in the Medical Department of Hong Kong. Appointment will be on two years' probation for permanent and pensionable employment, or on short-term contract, with gratuity on satisfactory completion of engagement. Salary, including pensionable expatriation pay, is in the scale \$1,530 to \$2,548.33 per annum (£1,147 10s. to £1,911 5s. per annum—one Hong Kong dollar equals 1s. 3d.). In addition a temporary, variable, non-pensionable cost-of-living allowance is payable according to family circumstances, and may be as much as £427 per annum for a married officer with children. Free passages in both directions are provided for an officer, his wife and up to three children under the age of 18. Quarters at rental of 1/8th of basic salary (i.e., from £117 to £204 per annum), according to salary. Income tax at local rates. Annual local leave is permissible and generous home leave is granted after each tour of four years. Climate is favourable for Europeans, a cool dry winter with well-marked change of seasons. Educational facilities are available. Candidates must be under 40 years of age and possess a medical qualification registrable in the United Kingdom. The officer selected would become Secretary of the Nutrition Advisory Council, and, in addition, would be required to carry out such medical duties as might be given him by the Director of Medical Services. Normal retiring age is 55. Officers who prefer short contract terms earn a gratuity of £37 10s. for each completed period of three months' service (but no pension). Pension is 1/600th of final pensionable emoluments for each completed month of reckonable service. Officers permanently employed are required to contribute to a widows' and orphans' pension scheme. Application forms can be obtained from the Director of Recruitment (Colonial Service), Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1 (quoting ref. 27215/164). (2274)

overseas—contd.

BASUTOLAND AND BECHUANALAND PROTECTORATE

Applications are invited from medical practitioners with qualifications registrable in the United Kingdom or in the Union of South Africa for appointment as

MEDICAL OFFICERS

Basutoland and in the Bechuanaland Protectorate. Appointment is will be on two years' probation for permanent and pensionable employment. Salary range: from £865 to £1,320 per annum. Private practice is permitted at the discretion of the Director of Medical Services. Candidates in the National Health Service may resign from the National Health Service but retain their superannuation rights during their time in Basutoland or Bechuanaland (up to six years) and receive a settlement grant of 20 per cent of the aggregate of their Basutoland or Bechuanaland salary on leaving these territories at the end of their engagements. Doctors appointed from the National Health Service may be considered for permanent terms at any time during their employment in the High Commission territories provided they surrender their rights to the resettlement grant and payment by Basutoland or Bechuanaland of superannuation contributions. Quarters are provided at rental of 10 per cent of salary. Local leave is permissible and generous home leave is granted after each tour of three to four years. Free passages provided for officer and wife, and assisted passages for children. Application forms can be obtained from the Director of Recruitment, Colonial Service, Sanctuary Buildings, Great Smith Street, London, S.W.1 (quoting reference No. 27215/62/52). (2332)

H.M. COLONIAL SERVICE, Bahamas DISTRICT MEDICAL OFFICERS

Required for service in the Out Islands of the Bahamas. Appointments will be on agreement for three years. Salary £600 per annum. Private practice is permitted. In addition a cost-of-living and devaluation allowance at the rate of £311 per annum is payable. Total issue is therefore at present £911 plus income from private practice. There is no income tax. Passages are provided for officers, wife and up to two children on appointment, and also for the return to the United Kingdom on the satisfactory completion of engagement. Candidates should possess medical qualifications registrable in the United Kingdom. The duties are similar to general practice in the United Kingdom. Application forms can be obtained from the Director of Recruitment, Colonial Service, Sanctuary Buildings, Great Smith Street, London, S.W.1 (quoting reference No. 27215/185/52). (2163)

HER MAJESTY'S COLONIAL SERVICE, Malaya

Doctors having medical qualifications registrable by the General Medical Council in the United Kingdom with one or more years' experience after qualification are required for appointment as

MEDICAL OFFICERS AND MEDICAL OFFICERS OF HEALTH

for General Medical and Health duties. Appointment is available (a) on probation for permanent establishment; (b) on employment from the National Health Service; and (c) on short-term contract with gratuity. (a) Permanent terms. Subject to three years' probation, appointment is permanent with pension (non-contributory) at age 55. Salary is paid in the scale 1952 by £42 to £1,204 to £1,274 to £42 to £1,652 per annum. There are many posts specialist and administrative, available on promotion carrying higher salaries (up to about £2,400 for the highest post). Promotion is often made before reaching the top (£1,652) of the long scale. There is also a cost-of-living allowance at varying rates, according to family circumstances, subject to a maximum of £336 per annum for single men, and of £707 per annum for married men with children (both rates higher when stationed in Singapore). Note. Doctors with more than one year's approved experience after age 25 (including service in Her Majesty's Forces) enter the salary scale at points above the minimum according to their experience; and four increments of salary are also given to holders of approved higher qualifications (e.g., F.R.C.S., M.R.C.P., D.P.M., D.A., etc.). (b) National Health Service. Doctors may resign from the National Health Service but retain their superannuation rights during their time in Malaya (up to six years) and receive a resettlement grant of 20 per cent of the aggregate of their Malaya salary on leaving Malaya at the end of their engagements. Emoluments as under (a), including incremental credit for experience and higher qualifications as in note under (a). Doctors so appointed may be considered for permanent terms at any time during their colonial employment provided they surrender their rights to the resettlement grant and payment by Malayan Governments of superannuation contributions. (c) Contract terms. The contract will be for three years' resident service renewable for a further tour of three years by mutual agreement. Salary and cost-of-living allowance as under (a), including incremental credit for experience and higher qualifications as in note under (a). In addition a gratuity earned at the rate of £300 to £450 per annum, according to salary, is paid on expiry of contract. Doctors on contract may be considered for appointment to the permanent establishment at any time on their agreeing to surrender their gratuity earning rights. In all three types

of appointment salary and gratuity refer to doctors only for expatriate terms under Malayan Regulations (i.e., those whose permanent homes are in the United Kingdom, Ireland, Australia, Canada, etc.). A limited number of practitioners liable for call up under the National Service Act, 1948, may apply, and if appointed will be granted indefinite deferment of call up on completion of a minimum period of one tour of three years in the Malayan Medical Service. The climate is, for the tropics, healthy. European children do well up to the age of about six and schools are available locally. Income tax is payable at Malayan rates, which are lower than those in the United Kingdom. Government quarters with heavy furniture are provided at a low rental, or an allowance is paid in lieu of quarters. Free passages are provided for the doctor, his wife, and children under the age of ten (not exceeding four persons besides himself) on appointment and once each way during each tour of duty of three to four years. Generous home leave is granted and local leave is permissible. The social and recreational facilities in Malaya are good. Application forms can be obtained from the Director of Recruitment (Colonial Service), Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1 (quoting reference No. 27215/242/51). (5187)

NOTICES

APPLICANTS ARE ADVISED NOT TO SEND original testimonials when replying to advertisements. Copies will answer the purpose quite as well, and in the event of their being lost or mislaid no inconvenience will ensue.

OPHTHALMIC NURSING BOARD

The Board has been established to promote and maintain a standard of efficiency in

OPHTHALMIC NURSING

and for this purpose to compile a syllabus of training, to hold examinations and to award Diplomas to candidates completing the required training and passing the examination of the Board. The constitution of the Board as decided at its first meeting requires the Board to determine which hospitals shall be recognized as providing an adequate course of nursing instruction for the diploma. Hospitals are accordingly invited to notify the Board at Moorfields Westminster and Central Eye Hospital, City Road, London, E.C.1, of their desire to be thus recognized. A form of application for admission to the Register of Approved Hospitals will then be sent.—Frank W. Law, Chairman, Ophthalmic Nursing Board. (2330)
